Subject:
Additional Information to Supplement PSD Air Permit Application and State Air Facility Permit Application (#3-1326-00275/00004)

Dear Mr. Tomasik and Mr. Riva:

On November 15, 2010, a letter was sent to the New York State Department of Conservation (NYSDEC) and United States Environmental Protection Agency (USEPA) responding to comments on the Prevention of Significant Deterioration (PSD) Air Permit Application and State Facility Air Permit Application (Air Permit Application) for the proposed Cricket Valley Energy Center (CVE). Comments were provided by NYSDEC and USEPA via the following correspondence:

- Letter from Steven C. Riva (USEPA) to Frederick Sellars, May 5, 2010
- Letter from Margaret Valis (NYSDEC) to Frederick Sellars, June 15, 2010
- Letter from Jeffrey Lawyer (NYSDEC) to Frederick Sellars, August 3, 2010

Most of the comments were fully addressed in the response letter. However, in our response letter, we also indicated that we would update the PSD Air Permit Application and the State Facility Permit Application with additional information including turbine vendor specifications, cumulative modeling for nitrogen dioxide

(NO_2), and updated state air permit forms. This package provides the information to supplement, and in some cases supplant, information provided in the Air Permit Application for CVE. In a conversation with Jeffrey Lawyer on January 4, 2011, he agreed that he would accept an updated version of the air resources section of the Draft Environmental Impact Statement (DEIS), rather than updated pages of the Air Permit Application. An updated version of the DEIS has been electronically submitted to Stephen Tomasik at NYSDEC on February 4, 2011 as a separate submittal. However, a copy of the updated section is also provided as Attachment 1 with this letter. There is additional updated information associated with the Air Permit Application, such as state air permit forms, that are not included in the air section of the DEIS. This updated information is also provided with this letter as described below

Revisions to Section 4.0 of the DEIS

A pre-review draft of Section 4.0 of the DEIS (Air Resources), with associated appendices, was originally submitted to Stephen Tomasik for NYSDEC review on October 22, 2010. Many of the agency comments referenced above had been addressed in this version. However, since that time, the DEIS section has been updated to reflect minor changes to project emissions, other text additions, remaining regulatory comments and a new regulatory requirement for a greenhouse Gas (GHG) Best Available Control Technology (BACT) analysis. Also, as indicated in our agency response letter, Section 4.0 of the DEIS has been updated to include cumulative modeling demonstrating compliance with the 1-hour nitrogen dioxide (NO_2) National Ambient Air Quality Standard (NAAQS).

Text and Emissions Updates

The project-related emissions and other DEIS text has been updated to accommodate additional changes to the project design. Specifically, the following changes have been made:

- Final selection of a combustion turbine vendor and model number, General Electric 7FA.05;
- Minor changes to start-up and shutdown emissions;
- Addition of a fourth black start generator;
- Addition of a minimum combustion turbine load case at 36 percent;
- Minor changes to tables updating the NAAQS for 1-hour NO_2, lead and 1-hour Sulfur Dioxide (SO_2), and;

- Inclusion of 1-hour SO_2 in the air quality modeling analysis.

1-hour NO_2 Cumulative Modeling

In response to a comment from USEPA, a cumulative modeling analysis has been conducted for 1-hour NO_2. With the assistance of the USEPA, NO_2 interactive modeling runs for CVE were made with the BETA version of AERMOD, B10363. The results demonstrate clearly that the CVE project does not contribute significantly to any predicted NAAQS violations.

Model runs to demonstrate compliance were performed in the following manner:

1) AERMOD was run for the CVE project (worst-case scenario) to identify receptors with predicted impacts above Significant Impact Levels (SILs).
2) Interactive model runs were performed for the full modeling domain, including all 692 receptors where CVE has predicted impacts above the 1-hour NO_2 SIL.
3) Receptors with predicted impacts above the NAAQS of 188 $\mu g/m^3$ were identified. Of the 692 receptors where the CVE project showed SIL exceedences for any hour modeled predicted 5-yr 98^{th} percentile concentrations at 681 receptors were below 185 $\mu g/m^3$., Five receptors had 5-year average predicted 8^{th} highest daily maximum 1-hour concentrations, including background that exceeded the NAAQS. The highest predicted 98^{th} percentile value at any of these receptors was 214 $\mu g/m^3$. Another six receptors had predicted 5-yr 98^{th} percentile concentrations below 188 $\mu g/m^3$, but above 185 $\mu g/m^3$, for a total of 11 receptors.
4) For those 11 receptors, predicted impacts were evaluated with and without the CVE emission sources. Predicted concentrations were compared for all days with at least one maximum 1-hour concentration exceeding the NAAQS, using MAXDAILY output tables. Between 33 and 87 exceedances were predicted at each of the 11 receptors, for a total of 499 exceedance-days.
5) For those 499 exceedance-days, the largest difference in the predicted daily maximum 1-hr NO_2 concentration at any receptor, with and without CVE's contribution, is 0.17 $\mu g/m^3$, far below the interim SIL of 7.5 $\mu g/m^3$.

This analysis demonstrates that none of the predicted 499 maximum daily 1-hour concentrations above the NAAQS at any of these11 receptors involved a significant contribution from the CVE project. Thus, the project will not contribute significantly to any predicted violation of the 1-hour NAAQS.

GHG BACT Analysis

On April 2, 2007, the Supreme Court found that GHGs, including carbon dioxide, are air pollutants covered by the Clean Air Act (CAA). On May 13, 2010, the USEPA issued a final rule (called the "Tailoring Rule") that establishes an approach to greenhouse gas emissions from stationary sources under the CAA. This final rule "tailors" the requirements of the CAA permitting program to limit which facilities will be required to obtain PSD permits. The CAA permitting program emissions thresholds for criteria pollutants are 100 tons per year or 250 tons per year. While these thresholds are appropriate for criteria pollutants, they are not feasible for GHG emissions as they are emitted in much greater quantities.

Beginning January 2, 2011, sources subject to the PSD program (i.e., new major sources such as CVE) are subject to permitting requirements for their GHG emissions under PSD. For these projects, those with GHG emission increases of 75,000 tpy or greater are required to determine BACT for their GHG emissions.

NYSDEC adopted amendments to their regulations on December 29, 2010 to include the provisions of the Tailoring Rule as described above.

CVE has triggered major source thresholds of pollutants other than GHGs. In addition, potential emissions of GHGs from the project exceed the 75,000 tpy threshold described above. As such, PSD review is required for GHG emissions, including a BACT analysis. The DEIS (section attached) has been updated to include a BACT analysis for GHGs.

Updated Air Permit Application Forms

NYSDEC air permit application forms have been updated in response to comments from Jeffrey Lawyer. The updated forms are provided as Attachment 2 with this package. The forms have been marked to indicate which pages have updated information. Specifically the following changes have been made:

- The black start emergency generators and fire pump have been identified as emission sources and processes/emission points for these sources have been defined;
- Unique processes have been defined for each combustion turbine, and natural gas has not been repeated as a process within the same emission source, and;

- Equipment information such as turbine manufacturer, model number, exhaust flow rate and other parameters have been updated to reflect the final choice in turbine vendor.

Additional Information for Air Permit Application

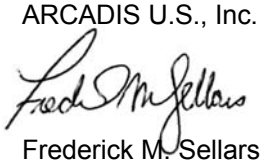
As mentioned previously, the Air Permit Application provided additional supporting documentation that was not included in the Air Resources section of the DEIS. The additional attached information is summarized below:

- Vendor information for fire pump, black start generators and auxiliary boiler
- Supporting Calculations for Modeling Results (provided on diskette)
    - Steady state
    - Startup/Shutdown plus auxiliary boiler
    - Auxiliary Boiler
    - Black Start Generator
    - Fire Pump
- Supporting Figures for Modeling Results
    - Land use Figures for AERSURFACE
    - 1-hour Carbon Monoxide (CO)
    - 8-hour CO
    - 1-hour NO_2
    - Annual NO_2
    - 24-hour Particulate Matter less than 2.5 microns ($PM_{2.5}$)
    - Annual $PM_{2.5}$
    - 24-hour Particulate Matter less than 10 microns (PM_{10})
    - 1-hour SO_2
    - 3-hour SO_2
    - 24-hour SO_2
    - Annual SO_2
- Computer Diskette with Modeling Files for 1-hour NO_2 cumulative modeling.

If you have any questions or comments regarding this supplemental information, please do not hesitate to contact me at 978-937-9999 ext 317 or frederick.sellars@arcadis-us.com. Thank you for your review of the CVE Air Permit Application. We look forward to continuing to work with you on this important project.

Sincerely,

ARCADIS U.S., Inc.



Frederick M. Sellars
Vice President

Section II - Identification Information

Project Description (continuation)

The project is comprised of three combined cycle units. Each unit consists of one F-Class Technology combustion turbine generator (CTG), one heat recovery steam generator (HRSG) with supplemental natural gas duct firing, one steam turbine generator (STG), and an associated air cooled condenser (ACC). The project is intended to operate as a base load facility and is proposing to operate 8,760 hours per year, incorporating a range of load conditions. In addition to the combustion turbines, the facility will contain ancillary combustion equipment including one natural gas fired auxiliary boiler, one diesel fired fire pump engine and four diesel fired black-start generators.

A detailed description of the proposed project is provided in Section 2.0 of the document.

Compliance Statements (Title V Only)

I certify that as of the date of this application the facility is in compliance with all applicable requirements: ☐ YES ☐ NO

If one or more emission units at the facility are not in compliance with all applicable requirements at the time of signing this application (the 'NO' box must be checked), the noncomplying units must be identified in the "Compliance Plan" block on page 8 of this form along with the compliance plan information required. For all emission units at this facility that are operating in compliance with all applicable requirements complete the following:

- ☐ This facility will continue to be operated and maintained in such a manner as to assure compliance for the duration of the permit, except those units referenced in the compliance plan portion of Section IV of this application.
- ☐ For all emission units, subject to any applicable requirements that will become effective during the term of the permit, this facility will meet all such requirements on a timely basis.
- ☐ Compliance certification reports will be submitted at least once a year. Each report will certify compliance status with respect to each requirement, and the method used to determine the status.

Facility Description (continuation)

air cooled condenser (ACC). Additional equipment includes selective catalytic reduction (SCR) and oxidation catalyst systems; continuous emissions monitoring systems (CEMS); aqueous ammonia storage tanks; one natural gas fired auxiliary boiler; one diesel fire pump; four diesel black-start generators; and a water treatment system including a zero-liquid-discharge system.

The natural gas is assumed to have a higher heating value (HHV) of approximately 961 British thermal units (Btu) per standard cubic foot (SCF) and a sulfur content of 0.5 grains per 100 SCF. The duct burners which supply additional energy to each HRSG will be natural gas fired and have an input capacity of 379.3 MMBtu/hr at the HHV for natural gas at ISO conditions.

Additional description of the intended operation of each piece of equipment, including proposed hours of operation, pollutant control technologies, and potential emissions is included in the narrative accompanying these application forms.

Process Information

☒ Continuation Sheet(s)

EMISSION UNIT	U-0001		PROCESS	P01

Description

Process P01 represents natural gas firing in the Unit #1 F-class combustion turbine with and without supplemental duct firing. Dry low-NOx combustion technology and selective catalytic reduction will be used to control emissions of NOx from the process. An oxidation catalyst will be used to control emissions of CO and VOC. The natural gas HHV is assumed to be 966 Btu per standard cubic foot. Please see Section 2.0 of the application for a more detailed process description.

Description

Facility will maintain a NOx emission limit of 2.0 ppmv at 15 percent O2 (w/ and w/o duct burning) as LAER. This will be achieved through the application of DLN burners in combination with SCR. This limit applies at all load conditions except startup and shutdown. The facility will use CEMS to monitor NOx stack emissions.

Description

Facility will maintain a PM10/PM2.5 emission limit of 0.005 lb/MMBtu without duct burning and 0.006 lb/MMBtu with duct burning as BACT for the proposed project. These levels of emissions will be achieved by combusting only commercially available, pipeline quality natural gas in the turbines and duct burner. The facility will demonstrate compliance with these limits via stack testing.

Process Information

“ Continuation Sheet(s)

EMISSION UNIT	U-0002		PROCESS	P04

Description

Process P04 represents natural gas firing in the Unit #2 F-class combustion turbine with and without supplemental duct firing. Dry low-NOx combustion technology and selective catalytic reduction will be used to control emissions of NOx from the process. An oxidation catalyst will be used to control emissions of CO and VOC. The natural gas HHV is assumed to be 966 Btu per standard cubic foot. Please see Section 2.0 of the application for a more detailed process description.

Description

Facility will maintain a NOx emission limit of 2.0 ppmv at 15 percent O2 (w/ and w/o duct burning) as LAER. This will be achieved through the application of DLN burners in combination with SCR. This limit applies at all load conditions except startup and shutdown. The facility will use CEMS to monitor NOx stack emissions.

EMISSION UNIT	U-0003		PROCESS	P05

Description

Process P05 represents natural gas firing in the F-class combustion turbine without supplemental duct firing. Dry low-NOx combustion technology and selective catalytic reduction will be used to control emissions of NOx from the process. An oxidation catalyst will be used to control emissions of CO and VOC. The natural gas HHV is assumed to be 966 Btu per standard cubic foot. Please see Section 2.0 of the application for a more detailed process description.

Description

Facility will maintain a NOx emission limit of 2.0 ppmv at 15 percent O2 (w/ and w/o duct burning) as LAER. This will be achieved through the application of DLN burners in combination with SCR. This limit applies at all load conditions except startup and shutdown. The facility will use CEMS to monitor NOx stack emissions.

Description

The proposed engine will be certified to meet the federal emission standards under 40 CFR 60 Subpart IIII for the current model years. Thus the engines will maintain a NOx + HC emission rate of 3.0 g/hp-hr. Compliance with these federal limits is also considered LAER. Compliance will be demonstrated via certification by the vendor and adherence to vendor specified maintenance recommendations.

Tier 3 Emissions Data - John Deere Power Systems

Nameplate Rating Information

Clarke Model	JX6H-UFADF0
Power Rating (BHP / kW)	460 / 343
Certified Speed (RPM)	1760

Certificate Data

John Deere Engine Rating	6135HFC48B
Engine Model Year *	2009
EPA Family Name	9JDXL13.5103
EPA Certificate Number	JDX-NRCI-09-24
CARB Executive Order Number	U-R-004-0370
Emissions Label Part Number	R528979

* The Engine Model Year is listed on the emissions label.

Emissions Data * *

Units	g/hp-hr	g/kW-hr
CO	0.53	0.71
Pm	0.087	0.116
NOx	2.6	3.48
HC	0.097	0.13
NOx + HC	2.69	3.61
Test Engine	RG6135X000770	

* * The emission data listed is measured from the calibration engine under laboratory test conditions. It is intended to represent an "average" engine but is not a guarantee that all engines meet these values.

Special Notes/Conditions

1. Carbon steel housings are suitable for use in all applications where the housing will not be insulated. Carbon steel housings may only be insulated in applications where the exhaust temperature does not exceed 900°F. If your application requires insulation with an engine exhaust temperature exceeding 900°F, a stainless steel housing is required. Customer installed insulation on carbon steel housings in applications where exhaust temperature exceeds 900°F voids any MIRATECH product warranty.
2. Quantities are per engine.
3. SCR units require a minimum temperature of 572°F (300°C) and a maximum temperature of 986°F (530°C). Several catalyst formulations are available with different optimum operating temperatures. The optimum operating temperature for this application is listed. Operating outside of the optimum range will change the reactant consumption and could cause damage to the catalyst.

- MIRATECH does not allow any silencer, packed or unpacked, to be installed upstream of any MIRATECH equipment. Installation of such equipment will void the warranty per MIRATECH Holdings Terms and Conditions.
- Final catalyst housings are dependent on engine output and required emission reductions. Changes may be made to optimize the system design at the time of order.
- Any drawings included with this proposal are preliminary in nature and could change depending on final product selection.

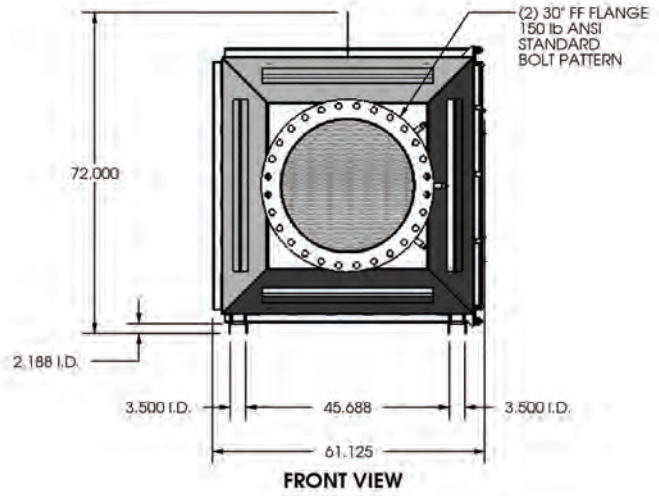
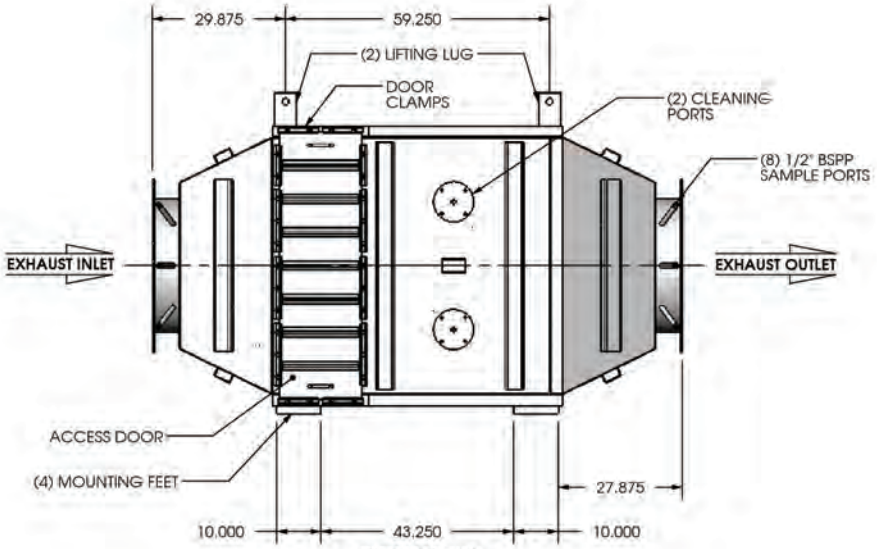
EMPTY HOUSING	2166 lb
ONE (1) FULL SCR CATALYST LAYER	1703 lb
TWO (2) FULL SCR CATALYST LAYERS	3428 lb

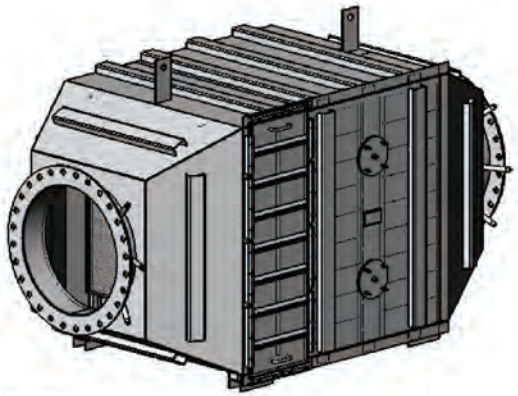
- HOUSING HAS CAPACITY FOR TWO (2) FULL SCR CATALYST LAYERS

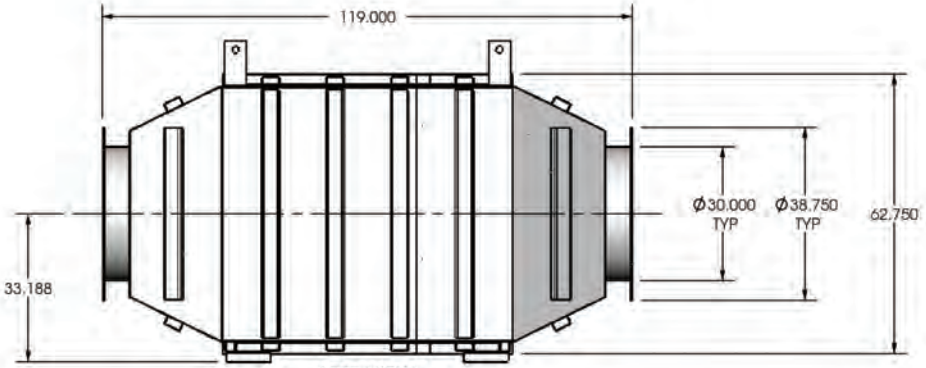


FRONT VIEW



RIGHT VIEW





LEFT VIEW

NOTES:

- ONLY USE LIFTING LUGS TO LIFT HOUSING
- ALLOW MINIMUM 28" CLEARANCE FROM DOOR FOR LOADING AND MAINTENANCE
- NO FORCES OR MOMENTS MAY BE APPLIED TO THE FLANGES
- MOUNTING FEET RECOMMENDED FOR HOUSING SUPPORT
- MUST BE MOUNTED HORIZONTALLY (CUSTOM HOUSING REQUIRED TO MOUNT VERTICALLY)

MATERIAL CONSTRUCTION:

- CARBON STEEL

Attention: Mr. Jeff Ahrens

RE: Cricket Valley Energy - Power Plant Aux Boiler Burners - Emissions

Ms. Ahrens:

In follow up to your request for design conditions and emission guarantees on the boiler for the Cricket Valley Energy Project I am pleased to offer the following for your review. I have provided thermal data on the boiler at the varying temperature conditions. In addition, please also see the letter from Coen Burner Company addressing Emission guarantees for our boiler.

Once you have had a chance to review the information I have provided please do not hesitate to contact me should you have any questions or require further assistance.

Very truly yours,

VICTORY ENERGY OPERATIONS, LLC

Att: Dianna Jarvis, Sales Associate

Subject: TODD ultra low NOx RMB Burner Performance for VEO 50,000 lb/hr saturated boiler for Crickett Valley Energy

Dear Dianna:

Coen Company Inc. is pleased to confirm emission guarantees when using a TODD ultra low NOx RMB burner mounted on a Victory Energy Operations LLC boiler designed for a nominal 50,000 lb/hr saturated steam. When operating the boiler with an economizer, the RMB burner will operate at approximately 62 mmbtu/hr at 100% boiler load when firing natural gas. The RMB burner will operate at a nominal 15% excess air and 30% flue gas recirculation at 100% boiler load. Emissions are guaranteed from twenty-five (25) to one hundred (100) percent of boiler load, as follows:

- Maximum emission levels on natural gas, with all concentrations corrected to 3% oxygen, on a dry basis, with high heating value of 1,000 Btu/scf and sulfur content of 0.2 grains/100 scf of fuel:

NOx	9 ppm (0.011 lb/mmbtu)
CO	50 ppm (0.0375 lb/mmbtu)
VOC	3 ppm (0.0015 lb/mmbtu)
PM/PM10/PM2.5	0.005 lb/mmbtu
SOx	0.0006 lb/mmbtu

Yours truly,

Paul Schwartz
Director Industrial Steam
Coen Company Inc.
