RE: Title V Operating Permit Renewal Application
Cricket Valley Energy Center, LLC

Dear Ms. Carbone,

Please find enclosed a Title V Operating Permit (TVOP) renewal application prepared by Tetra Tech for the Cricket Valley Energy Center, LLC (CVEC) located in Dover, NY. CVEC's TVOP Permit ID 3-1326-00275/00009 expires on February 2, 2021. In accordance with the Title 6 of the New York Code, Rules and Regulations, Subpart 201 (6 NYCRR 201-6.2(a)(4)), a renewal application must be submitted no later than 180 days prior to expiration of the permit, which is August 6, 2020.

This application does not propose any modifications to the current TVOP. We do note that Condition 1-13 (pages 41-42) in the current TVOP has compliance language for natural gas but this Condition is for the fire pump engine and the language should be for diesel. We also request a correction for Condition 23.2, that the ammonia limit of 5.0 ppmvd corrected to 15% Oxygen limit applies "*during all turbine loads, **excluding combustion turbine startup and shutdown**, all fuels being fired and all duct burner operations*."

Additionally, the Auxiliary Boiler (Process P02) is not equipped with Flue Gas Recirculation as it can meet its NO_x emission limit with the installed low-NO_x burners. Therefore, Emission Source/Control FGR01 has been removed in the TVOP renewal application.

This application includes an update to the proposed Startup and Shutdown Limits, as required by Condition 24 of TVOP, that was submitted to the Department on May 20, 2020. Based upon discussions with the Department, additional startup and shutdown data have been reviewed through June 2020. Provided in Attachment 8 are proposed Startup and Shutdown Limits.

Please contact me at 617-320-5219 or mduquette@cricketvalley.com if you have any questions regarding this application.

Sincerely,

Marc J. Duquette
Director, Environmental Health and Safety

1.0 INTRODUCTION

Cricket Valley Energy Center, LLC (CVEC) was issued Permit Number 3-1326-00275/00009 (the Permit) for the construction and operation of the Cricket Valley Energy Center (the Facility), a nominal net 1,000-megawatt (MW) combined-cycle electric generating facility, on a site located in Dover, Dutchess County, New York. In accordance with New York State Department of Environmental Conservation's (NYSDEC) regulations, the Permit authorized both construction of the facility in accordance with Title 6 New York Codes, Rules and Regulations (6 NYCRR) Part 231 and operating as a Title V source in accordance with 6 NYCRR Part 201-6. The Permit expires on February 2, 2021 and this application has been submitted more than 180 days prior to expiration in accordance with 6 NYCRR Part 201-6.2(a)(4)).

CVEC operates three General Electric (GE) Model 7FA.05 combustion turbine generators (CTGs) operating in combined-cycle mode with supplemental firing of the heat recovery steam generators (HRSGs). Natural gas is the sole fuel fired in the CTGs and duct burners. In addition to the CTGs, the facility operates a natural gas-fired auxiliary boiler, a 1,500-kilowatt (kW) ultra-low sulfur distillate (ULSD) fired emergency generator engine, and a 260-horsepower (hp) ULSD-fired emergency fire pump engine.

CVEC is operating in compliance with the Permit.

1.1 APPLICATION OVERVIEW

1.1.1 Application Organization

In accordance with NYSDEC regulations and guidance, a Title V Permit renewal application must contain all information required for an initial Title V Permit. This application includes the following:

- Application Forms
- List of Exempt Activities
- Plot Plan
- Process Flow Diagrams
- Methods Used to Determine Compliance
- Emission Calculations

2.0 FACILITY DESCRIPTION

2.1 FACILITY DESCRIPTION

The facility is located in Dover, Dutchess County, New York. The Facility uses GE 7FA.05 combustion turbine technology; supplemental (duct) firing in the combined-cycle unit HRSGs is incorporated into the facility's design. An auxiliary boiler is used to assist plant start-up and maintain warm or hot-start conditions during standby periods. The sole fuel for the CTGs, duct burners and auxiliary boiler is natural gas. The facility operates a 1,500 kW ULSD-fired emergency generator engine and a 260-hp ULSD-fired emergency fire pump engine to support facility operations. ULSD is the sole fuel for the emergency generator and emergency fire pump engines. An air-cooled condenser is a dry cooling system where steam is condensed inside air-cooled finned tubes; this system component is not an emission source.

2.2 DESCRIPTION OF SIGNIFICANT EMISSION SOURCES

2.2.1 Combustion Turbine Generators and Duct Burners

Thermal energy is produced by combustion of natural gas in the three CTGs and each CTG is capable of running independently of the other. The thermal energy is converted to mechanical energy in the CTG that drives its integral compressor and electric generator. Each CTG has a rated heat input of 2,395.7 million British thermal units per hour (MMBtu/hr). The duct burners in each HRSG have a permitted heat input of 247 MMBtu/hr, which was used as the basis for determining the potential to emit (PTE).

Each HRSG is equipped with a selective catalytic reduction (SCR) system to control nitrogen oxide (NO_x) emissions and an oxidation catalyst to control carbon monoxide (CO) and volatile organic compound (VOC) emissions from the CTG and duct burners. The SCR uses 19 percent aqueous ammonia (NH_3) as a reagent. The aqueous NH_3 is injected into the flue gas stream upstream of the SCR catalyst, where it mixes with NO_x. A catalyst bed is located in a temperature zone of the HRSG where the catalyst is most effective. The exhaust gases pass through the catalyst where the NO_x reacts with NH_3 to form nitrogen gas (N_2) and water (H_2O). NO_x concentrations are controlled to 2.0 parts per million by volume dry basis corrected to 15 percent O_2 (ppmvdc), with or without duct-firing, during all steady-state operating load conditions, including with and without duct firing. A small amount of NH_3 passes through the catalyst and is emitted to the atmosphere, which is called "ammonia slip."

Exhaust gases from the CTGs and duct burners pass through the oxidation catalyst where excess air oxidizes the CO and VOC to form carbon dioxide (CO_2) and H_2O. The oxidation catalyst system reduces CO concentrations to no greater than 2.0 parts per million by volume dry basis corrected to 15 percent O_2 (ppmvdc), with or without duct-firing, during all steady-state operating load conditions, including with and without duct firing. VOC concentrations are controlled to 0.7 ppmvdc without duct firing, and 2.0 ppmvdc with duct firing.

2.2.2 Auxiliary Boiler

The Facility operates an auxiliary boiler rated at 60 MMBtu/hr to assist with startup of the CTGs by maintaining warm or hot-start conditions during most standby periods. The auxiliary boiler fires natural gas as the sole fuel and operates as needed to keep the HRSG warm during periods when the CTGs are not operating and provide steam to the steam turbine generator to minimize start-up duration. The auxiliary boiler is limited to a maximum of 4,500 hours of operation per rolling 12-month period. The auxiliary boiler is equipped with low-NO_x burners to minimize NO_x emissions. Emissions of all other pollutants are minimized by using natural gas as the sole fuel and by employing good combustion practices.

2.2.3 Emergency Generator Engine

The Facility operates a Caterpillar Model 3512C emergency generator engine rated at 1,500 kW (electrical) to provide power to the Facility during periods when there is loss of power from the grid, for emergency lighting and other necessary systems to ensure plant safety. The emergency generator engine fires ULSD and has a mechanical power rating of 2,206 hp. The emergency generator engine is only used during periods when power from the grid is unavailable and for testing to maintain operational readiness in the event of an emergency. Therefore, operating hours are limited to 500 hours per year. The emergency generator engine has an associated small ULSD storage tank.

2.2.4 Emergency Diesel Fire Pump Engine

The Facility operates a Clarke Model JU6H-UFADS8 emergency fire pump powered by a John Deere Model 6068HFC48 engine rated at 260 hp (mechanical) to provide on-site firefighting capabilities. The emergency fire pump engine fires ULSD and typically only operates for testing and to maintain operational readiness in the event of an emergency. Similar to the emergency generator, it is limited to a maximum of 500 operating hours per year. The emergency fire pump engine has an associated small ULSD storage tank.

2.3 DESCRIPTION OF INSIGNIFICANT EMISSION SOURCES

The Facility utilizes ancillary equipment to support facility operations. This ancillary equipment is exempt from Title V permitting requirements as Exempt Activities in accordance with 6 NYCRR Subpart 201-3.2. The Facility also includes a number of Trivial Activities as defined under 6 NYCRR Subpart 201-3.3.

2.3.1 Aqueous Ammonia Storage Tanks

The Facility includes a 19 percent by weight aqueous NH_3 tank for use in the SCR system. The tank is exempt from air permitting as a pressurized storage vessel in accordance with 6 NYCRR Subpart 201-3.2(22).

2.3.2 Fuel Oil Storage Tank

The emergency generator and emergency fire pump engines each have a dedicated ULSD storage tank. These tanks are exempt from air permitting as distillate fuel storage tanks with a capacity less than 300,000 gallons in accordance with 6 NYCRR Subpart 201-3.2(21).

2.3.3 Trivial Activities

The Facility conducts the following trivial activities:

- Boiler water treatment operations;
- Office equipment - copying machines, computer/word processor printers, blueprint copying machines, paper shredders, and photographic processing equipment;
- Hand-held or manually operated equipment used for buffing, polishing, carving, cutting, drilling, machining, routing, sanding, sawing, surface grinding, sand blasting or turning ceramic art work, ceramic precision parts, leather, metal parts, plastics. fiberboard, fiberglass, masonry, carbon, glass, graphite, wood or rubber;
- General facility maintenance activities - plastic pipe welding, soldering, brazing, cutting torches, janitorial activities, steam cleaning, water washing, acid and caustic washing activities, miscellaneous use of solvents, adhesives and caulking, miscellaneous sandblasting, non-asbestos insulation removal, application of refractory and insulation, the periodic use of air for clean-up, and, the process of demolition and rebricking boilers, smelters, furnaces and kilns (this does not include the subsequent operation of such

equipment), the surface coating of equipment and buildings as is related to maintenance and construction, and activities which occur for maintenance of grounds such as lawn care, weed control and pest control;
- Employee/visitor activities - smoking areas for the consumption of tobacco products, cooking equipment for food, comfort air conditioning systems, hot water tanks, and clothes dryer vents;
- Vehicle emissions - vehicle emissions from forklifts, automobiles, trucks, cranes, bulldozers, etc.;
- Storage of portable containers, drums, and bags of chemicals in rooms, buildings and warehouses;
- Trivial activities that have been identified by U.S. EPA in Appendix A of the "White Paper" issued on July 10, 1995.

2.4 EMISSIONS ESTIMATES

2.4.1 Potential Annual Emissions

Air emissions from the Facility consist of products of combustion from the CTGs, duct burners, auxiliary boiler, and two emergency engines. Emissions from the insignificant activities and trivial activities have not been quantified in accordance with OAC Chapter 3745-77-03(C)(3). The Facility does not operate any sources of fugitive emissions with quantifiable emissions and therefore, fugitive emissions are not provided with this application.

Table 2-1 presents a summary of the potential annual criteria pollutant, GHG, and total hazardous air pollutants (HAPs) emissions for each significant emission source listed in Section 2.2 in units of tpy.

Table 2-1. Summary of Potential Emissions For Significant Emission units (tpy)

Pollutant	CTGS	Auxiliary Boiler	Emergency Generator Engine	Emergency Fire Pump Engine	Facility Total
NO_x	244.0	1.15	5.84	0.43	251.4
CO	287.8	4.99	3.16	0.37	296.3
VOC	94.9	0.20	0.24	0.03	95.4
SO_2	37.8	0.15	0.005	0.001	38.0
$PM_{10}/PM_{2.5}$	173.3	0.68	0.18	0.02	174.1
H_2SO4	20	0.01	0.0004	0.00005	19.7
GHG	3,577,129	15,811	595	74	3,593,609
Total HAPs	17.67	0.25	0.02	0.003	17.9

Supporting emission calculations for Table 2-1 are provided in Appendix F.

2.4.2 Startup and Shutdown Emissions

Condition 24 of the Permit requires the Facility to monitor all occurrences of startup and shutdown from the combustion turbines, including the duration of each startup and shutdown event, and the total pounds of emissions of NO_X, CO, and NH_3 during each startup and shutdown event.

Condition 24 also requires the Facility to submit proposed startup and shutdown limits to the Department. Initial proposed limits were submitted to NYSDEC by email on May 20, 2020, based on actual startup and shutdown data

through April 30, 2020. NYSDEC has agreed that the Facility may submit revisions to the proposed startup and shutdown limits as part of this application.

Table 2-2 presents the currently proposed startup and shutdown limits, which are based on an updated analysis of actual operating and emissions data for a total of 131 startup events and 121 shutdown events, occurring between February 21 and June 30, 2020. A detailed description of this analysis, and requested permit language for the proposed startup and shutdown limits, are provided in Appendix G.

Table 2-2. Proposed Startup and Shutdown Limits for Combustion Turbines

Type of Event	Duration (minutes)	NO_X (lb/event)	CO (lb/event)	NH_3 (lb/event)
Startup	60	80.0	330.0	25.0
Shutdown	20	5.0	5.0	3.0

The initial application for the Permit was based upon a maximum startup duration of 60 minutes. However, the Facility has experienced several startup events on all three units longer than 60 minutes since the Facility has achieved commercial operation. CVEC is reviewing startup procedures with GE to make every effort to limit startup duration to less than 60 minutes. However, CVEC does not want to propose a permit limit that cannot be met consistently. Therefore, CVEC may propose a startup duration longer than 60 minutes pending the outcome of the review of startup procedures with GE. Should CVEC determine that a longer startup time is necessary, we will provide NYSDEC with a detailed analysis to document why the longer duration is necessary with supporting documentation from GE. If deemed necessary by CVEC, a proposal for a longer startup duration will be provided to NYSDEC within 45 calendar days of submittal of the application. The proposed pound per event limits in Table 2-2 are supported by the analysis of facility-specific SU/SD data provided in Appendix G and consequently would not be changed by any future proposed change in startup duration.

Appendix G also requests that a condition be added to define a “tuning event,” which is a twice-yearly maintenance activity performed on each combustion turbine to optimize its performance prior to each summer and winter season. The requested permit language states that the emission limits for steady-state operation, startup, and shutdown would not apply during “tuning events,” and states that each turbine would be allowed up to two tuning events per calendar year, not to exceed four hours per event.

Finally, Appendix G requests modified permit language for the existing ppmvd limits for NO_X, CO, and NH_3, to state that the steady-state ppmvd limits do not apply to any 1-hour average that contains at least one minute of startup or shutdown, and do not apply to any 1-hour average that includes part of a tuning event.

3.0 REGULATORY APPLICABILITY EVALUATION

This section contains an analysis of the applicability of federal and state air quality regulations to the proposed Facility. The specific regulations and programs that are included in this review include:

- New Source Review (NSR);
- New Source Performance Standards (NSPS);
- Federal National Emission Standards for Hazardous Air Pollutants (NESHAP);
- Federal Acid Rain Program; and
- Other NYSDEC requirements.

3.1 NEW SOURCE REVIEW

NSR applies to proposed new major sources of air pollutants. The NSR program for major sources includes two distinct permitting programs, Prevention of Significant Deterioration (PSD) permitting for projects located in an area designated as unclassified or attainment with the National Ambient Air Quality Standards (NAAQS) and Non-Attainment New Source Review (NNSR) permitting for projects located in an area designated as nonattainment with the NAAQS. As an area may be in attainment with one or more NAAQS and nonattainment with one or more NAAQS at any time, an individual project may be subject to both PSD and NNSR permitting depending upon its potential emissions. The NYSDEC has adopted under Title 6 New York Codes, Rules and Regulations (NYCRR) Part 231 permitting requirements for new sources that establishes the requirements for projects subject to NNSR and/or PSD requirements. Dutchess County is designated as unclassified or attainment with all applicable ambient air quality standards. However, all of New York State is located in the Ozone Transport Region and therefore, the entire state is treated as a marginal nonattainment area for ozone.

Under the NNSR program, a project located in an area designated as nonattainment for ozone must satisfy NNSR requirements for NOx and/or VOC emissions if they exceed the NNSR thresholds. The NNSR thresholds for NO_x and VOC emissions in Dutchess County are 100 tons per year (tpy) and 50 tpy, respectively. Under the PSD program, combined-cycle CTG power plants with potential emissions greater than 100 tpy of one or more criteria pollutants are considered new major stationary sources. Once a major source threshold is triggered for one pollutant under the PSD program, PSD review must also be completed for all pollutants whose potential emissions exceed their respective Significant Emission Rate (SER).

Table 3-1 presents a comparison of the Facility's potential emissions with the applicable NNSR and PSD major source thresholds. As summarized in Table 3-1, the Facility exceeds the NNSR major source thresholds for NO_x and VOC emissions and exceeds the PSD major source threshold for NO_x, CO, and $PM_{10}/PM_{2.5}$. In addition, the Facility's potential emissions of VOC, sulfuric acid (H_2SO_4), and greenhouse gases (GHGs) exceed their respective SER and, therefore, PSD review is also required for these pollutants.

The Permit contains all applicable requirements under the PSD and NNSR programs.

Table 3-1. Summary of Permitted Potential Emissions and NSR Thresholds

Pollutant	Annual Emissions (tpy)	NNSR Major Source Threshold (tpy)	PSD Major Source Threshold (tpy)	PSD SER (tpy)	NNSR Applies? (Yes/No)	PSD Applies? (Yes/No)
PM_{10}	174.1	N/A	100	15	N/A	Yes
$PM_{2.5}$	174.1	N/A	100	10	N/A	Yes
SO_2	38.0	N/A	100	40	N/A	No
NO_x	251.4	100	100	40	Yes	Yes
CO	296.3	N/A	100	100	N/A	Yes
VOC	95.4	50	100	40	Yes	Yes
H_2SO_4	19.7	N/A	100	7	N/A	Yes
Pb	1.3×10^{-3}	N/A	10	0.6	N/A	No
GHGs[a]	3,593,609	N/A	NA	75,000	N/A	Yes

[a] GHGs are expressed as carbon dioxide equivalents (CO_2e). Note that as of a June 23,2014, Supreme Court Decision, GHG emissions cannot determine major source status. The United States Environmental Protection Agency (USEPA) issued a Policy Memo dated July 24, 2014, indicating that it will apply the current GHG SER threshold for requiring PSD BACT review for GHG "anyway" sources.

3.2 NEW SOURCE PERFORMANCE STANDARDS

NSPS are technology-based standards applicable to new and modified stationary sources. NSPS have been established for approximately 70 source categories. Several NSPS subparts apply to the Facility. Following is a description of the applicable subparts and the Facility's compliance with these standards.

3.2.1 40 CFR 60 Subpart A – General Provisions

Any source subject to an applicable standard under 40 Code of Federal Regulations (CFR) 60 is also subject to the general provisions under Subpart A. Because the Facility is subject to other Subparts of the regulation, the requirements of Subpart A also apply. The Facility has complied with the applicable notifications, performance testing, recordkeeping, and reporting outlined in Subpart A.

3.2.2 40 CFR 60 Subpart KKKK – Stationary Combustion Turbines

Subpart KKKK places emission limits on NO_x and SO_2 on the combustion turbines and duct burners. For new CTGs firing natural gas with a rated heat input greater than 850 MMBtu/hr, the applicable NO_x emission limits are:

- 15 ppmvdc for natural gas and 42 ppmvdc for oil; or
- 54 nanograms per Joule (ng/J) of useful output (0.43 pounds per megawatt-hour [lb/MW-hr]) for natural gas and 160 ng/J or useful energy output (1.3 lb/MW-hr) for oil.

Additionally, SO_2 emissions are limited to:

- Emissions limited to 110 ng/J (0.90 lb/MW-hr) gross output; or
- Emissions limited to 26 ng/J (0.060 lb/MMBtu).

The CTGs and duct burners are controlled with an SCR system to limit NO_x emissions to 2.0 ppmvdc for natural gas firing. SO_2 emissions are limited to 0.0015 lb/MMBtu by firing pipeline-quality natural gas.

Additionally, the provisions of this Subpart require continuous monitoring of NO_x emissions, which can be satisfied by use of a 40 CFR Part 75 certified NO_x continuous emissions monitoring system (CEMS). Each combustion turbine is equipped with a CEMS.

3.2.3 40 CFR 60 Subpart TTTT – Greenhouse Gas Emissions for New or Modified Electric Generating Units

Subpart TTTT limits carbon dioxide (CO_2) emissions from new CTGs with an annual capacity factor (on a 3-year rolling basis) that exceeds its "design efficiency" as defined in the rule. The combustion turbines and duct burners are subject to this standard and the applicable limit is 1,000 pounds of CO_2 per megawatt-hour (lb CO_2/MW-hr) gross energy output or 1,030 lb CO_2/MW-hr net energy output on a rolling 12-month basis. The Facility continuously monitors CO_2 emissions in accordance with 40 CFR Part 75 and gross electrical output in accordance with Subpart TTTT to demonstrate compliance with this emission limit. The Subpart TTTT applicable requirements, including emission limits, operating limits, monitoring, recordkeeping, and reporting, have been included in the applicable requirements provided in the eBusiness Center Title V application form.

3.2.4 40 CFR 60 – Subpart Dc – Small Industrial-Commercial-Institutional Steam Generating Units

Subpart Dc is applicable to steam generating units with a maximum heat input capacity greater than 10 MMBtu/hr and less than 100 MMBtu/hr. The installed auxiliary boiler has a maximum heat input capacity of 60 MMBtu/hr and is subject to this standard. The standard requires initial notifications at the start of construction and at initial start-up. In addition, records must be maintained regarding the amount of fuel burned on a monthly basis. No emission or operating limits are imposed by this standard on natural gas fired boilers.

3.2.5 40 CFR 60 – Subpart IIII – Stationary Compression Ignition Internal Combustion Engines

Subpart IIII is applicable to owners and operators of stationary compression ignition (CI) internal combustion engines that commence operation after July 11, 2005. This standard applies to the emergency generator and emergency fire pump diesel engines.

For model year 2009 and later, fire pump engines with a displacement less than 30 liters per cylinder and an energy rating between 175 and 300 hp, Table 4 of Subpart IIII provides the following emission limits:

- 3.0 grams per horsepower-hour [g/hp-hr]) of NOx + VOC
- 2.6 g/hp-hr of CO
- 0.15 g/hp-hr of PM

To comply with Subpart IIII, new emergency stationary CI generator engines with a displacement less than 30 liters per cylinder must meet the emission standards per 40 CFR 60.4205(b). The applicable limits for a 2,206-hp mechanical emergency generator engine (1,500 kW electrical) are USEPA's Tier 2 limits as follows:

- 4.8 g/hp-hr of NO_x + VOC
- 2.6 g/hp-hr of CO
- 0.15 g/hp-hr of PM

Compliance with these emission standards are demonstrated by purchasing an engine that has been certified by the manufacturer to meet these limits. The Facility has purchased engines meeting these limits as certified by the manufacturer. In addition to these emission limits, this standard imposes operating restrictions, maintenance requirements, and recordkeeping requirements. The Subpart IIII requirements applicable to each engine, including

emission limits, operating limits, monitoring, recordkeeping, and reporting, have been included in the applicable requirements provided in the application forms.

3.3 NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS (40 CFR PARTS 61 AND 63)

There are no 40 CFR Part 61 standards applicable to the Facility's operations. USEPA AP-42 emission factors, other applicable emission factors, and vendor information were reviewed to determine the Facility's applicability to a standard under 40 CFR Part 63. Based on potential emission calculations, the potential emissions of a single HAP do not exceed the major source threshold of 10 tpy and potential emissions of combined HAPs are less than the major source threshold of 25 tpy. Therefore, the major source NESHAP standards under 40 CFR Part 63 are not applicable to the Facility.

NESHAP Subpart YYYY is applicable to new combustion turbines located at major sources of HAP emissions. CVEC is a minor source of HAP emissions and therefore, NESHAP Subpart YYYY does not apply.

The USEPA has also promulgated a variety of standards applicable to area sources, those sources that are not considered major sources of HAPs. NESHAP Subpart JJJJJJ applies to certain industrial, commercial, and institutional boilers located at an area source. Natural gas fired boilers are exempt from this standard and therefore it does not apply to the auxiliary boiler.

NESHAP Subpart ZZZZ applies to reciprocating internal combustion engines located at an area source. In accordance with this NESHAP, new emergency engines are required to meet the requirements under the applicable NSPS. As discussed in Section 3.2.5, the emergency generator and emergency fire pump engines meet the NSPS requirements under 40 CFR 60 Subpart IIII and therefore are compliant with NESHAP Subpart ZZZZ.

3.4 ACCIDENTAL RELEASE PROGRAM

Section 112(r) of the Clean Air Act governs the storage and handling of certain chemicals. Aqueous NH_3 at a concentration of 19% by weight will be used as the reagent for the SCR systems for controlling NO_x emissions. Facilities that store aqueous NH_3 solutions containing less than 20% ammonia by weight are not subject to the accidental release requirements under Section 112(r) and are not required to prepare a Risk Management Plan in accordance with 40 CFR 68, Subpart G.

3.5 ACID RAIN PROGRAM

Title IV of the Clean Air Act Amendments required USEPA to establish a program to reduce emissions of acid rain forming pollutants, called the Acid Rain Program. The overall goal of this program is to achieve significant environmental benefits through reduction in SO_2 and NO_x emissions. To achieve this goal, the program employs a market-based approach for controlling air pollution. Under the market-based aspect of the program, affected units are allocated SO_2 allowances by the USEPA, which may be used to offset emissions, or traded under the market allowance program. In addition, to ensure that facilities do not exceed their allowances, affected units are required to monitor and report their emissions using a CEMS system or optional emissions data protocol per Appendix D, as approved under 40 CFR Part 75.

The Facility is subject to the Acid Rain Program based on the provisions of 40 CFR 72.6(a)(3) because the combined cycle gas turbine units are considered "utility units" under the program definition and they do not meet the exemptions listed under paragraph (b) of this Section. The Facility's Acid Rain Permit is incorporated into the Permit. The Facility is operating in accordance with its Acid Rain permit. A renewal application for the Acid Rain Permit is provided in Appendix H.

3.6 CROSS-STATE AIR POLLUTION RULE

The Cross-State Air Pollution Rule (CSAPR) went into effect on January 1, 2015, and replaced the Clean Air Interstate Rule (CAIR). New York is subject to the CSAPR and subject units must comply with the program. The facility's three CTGs are subject units and therefore must comply with CSAPR.

The NYSDEC has adopted regulations under 6 NYCRR Parts 243 (NO_x Ozone Season Group 2 Trading Program), 244 (NO_x Annual Trading Program), and 245 (SO_2 Group 1 Trading Program) to administer the CSAPR program in New York. In accordance with these regulations, the NYSDEC controls the allowance allocation and accounting process; emissions are reported to the United States Environmental Protection Agency (EPA) through their Clean Air Markets program, specifically via the Acid Rain CEMS installed on each budget unit. The NYSDEC CSAPR rules establish both seasonal and annual power plant emission budgets for SO_2 and NO_X based upon the budgets established for New York State by the EPA. "Seasonal" refers to the five-month ozone season (OS, May 1st through September 30th). New York sources are subject to the annual NO_X allowance program, the Group 2 NO_X OS allowance program, and Group 1 annual SO_2 allowance program. For states in designated Group 1 or Group 2 programs (not relevant to the annual NO_X program), the Group 1 and Group 2 allowances are not interchangeable.

The facility will receive an allocation from New York's CSAPR New Unit Set Aside (NUSA) account for each of the three budget programs. The facility must secure sufficient allowances through the NUSA account, and the allowance market place if necessary, to cover actual emissions for each calendar year. CVEC's first compliance year under the three CSAPR budget rules will be the 2020 operating year. CSAPR does not impose any new permitting requirements on the facility. The facility will comply with the applicable CSAPR requirements.

3.7 STATE OF NEW YORK REGULATIONS

In addition to regulations already discussed in preceding sections, state regulations that pertain to this Facility are listed in Table 3-2. Titles shown in italics in the table are permits, notifications, and/or reports needed for construction and operation of the Facility.

Table 3-2. NYSDEC Applicable Regulations

Rule	Description
6 NYCRR Part 201-6	*Title V Permits*
6 NYCRR Part 202-1	Emissions test methods and procedures for new and existing sources
6 NYCRR Part 225-1	Limits sulfur content of fuels
6 NYCRR Part 227-1	Control of particulate and visible emissions from stationary sources
6 NYCRR Part 227-2	Reasonably Available Control Technology (RACT) for Major Facilities of NOx
6 NYCRR Part 231	*Permit to Install New Sources of Pollution*
6 NYCRR Part 242	CO_2 Budget Trading Program
6 NYCRR Part 251	CO_2 Performance Standards for Major Electric Generating Facilities

The requirements of the regulations listed in Table 3-2 that apply to the facility are provided in the Title V application forms.

3.7.1 Regional Greenhouse Gas Initiative

The NYSDEC has adopted regulations under 6 NYCRR Part 242 (CO_2 Budget Trading Program), to administer the Regional Greenhouse Gas Initiative (RGGI) program in New York. RGGI is a cooperative effort of ten Northeast and Mid-Atlantic states (Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, New Jersey, Rhode Island, and Vermont) to implement a regional cap-and-trade program to control CO_2 emissions from power plants. The RGGI program requires electric generating units equal to or greater than 25 MW to hold sufficient CO_2 allowances to cover actual emissions. Facilities subject to the Acid Rain Program quantify emissions in accordance with 40 CFR 75. New York's program does not allocate allowances to subject units, all allowances must be purchased through auctions held quarterly. CVEC's first compliance year under the RGGI program rule will be the 2020 operating year.

Facility Description ☐ Continuation Sheet(s)

The facility is an electric generating plant with three General Electric Model 7FA.05 natural gas fired combustion turbine generators (CTGs) operating in combined cycle mode. The exhaust from each CTG is sent to a heat recovery steam generator (HRSG) to generate additional electricity in a steam turbine generator (STG). Each HRSG is equipped with natural gas fired duct burners to create additional steam during periods of peak demand.

Compliance Statements (Title V Applications Only)

I certify that as of the date of this application the facility is in compliance with all applicable requirements. ☒ Yes ☐ No

If one or more emission units at the facility are not in compliance with all applicable requirements at the time of signing this application (the 'NO' box must be checked), the noncomplying units must be identified in the "Compliance Plan" block on page 8 of this form along with the compliance plan information required. For all emission units at the facility that are operating in compliance with all applicable requirements, complete the following:

☒ This facility will continue to be operated and maintained in such a manner as to assure compliance for the duration of the permit, except those emission units referenced in the compliance plan portion of this application.

☒ For all emission units subject to any applicable requirements that will become effective during the term of the permit, this facility will meet such requirements on a timely basis.

☒ Compliance certification reports will be submitted at least once per year. Each report will certify compliance status with respect to each applicable requirement, and the method used to determine the status.

Section III - Facility Information

Facility Description (continuation)

Combustion emissions from the CTGs and duct burners are controlled by the use of natural gas as the sole fuel and good combustion practices. Additional reduction in emissions of nitrogen oxides (NOx) and carbon monoxide (CO) are achieved through the use of selective catalytic reduction (SCR) and an oxidation catalyst, respectively.

In addition to the primary electric generating equipment, the facility includes a natural gas fired auxiliary boiler, a 1,500 kilowatt (kW) emergency diesel generator engine, a 260 horsepower emergency diesel fire pump engine, an air cooled condenser (ACC), an aqueous ammonia storage tank, and a waste water treatment system.

Additional details are provided in the attached application text, completed application forms, supporting emission calculations and vendor equipment specifications.

Emission Unit U-00001 Process P01

Process Description

Natural gas firing of the GE 7F.05 combustion turbine (CT001) with and without supplemental firing (DB001). Dry low-NOx combustors (DLN01) and selective catalytic reduction (SCR01) will be used to control NOx emissions. An oxidation catalyst (OXC01) will be used to control CO and VOC emissions. Natural gas throughput rates based upon a heat content of 1,000 BTU/CF (HHV) and include both CT001 and DB001. Quantity per hour is based upon maximum hourly rate for all ambient conditions and quantity per year is based upon maximum hourly rate at ISO conditions for 8,760 hours per year.

Compliance Activity Description

Facility will maintain a NOx emission limit of 2.0 ppmv at 15 percent O2 (w/ and w/o duct burning) to satisfy LAER. This will be achieved through the application of DLN burners in combination with SCR. This limit applies at all load conditions except startup and shutdown. The facility will use CEMS to monitor NOx stack emissions.

Process Description

Natural gas firing of the GE 7F.05 combustion turbine (CT002) with and without supplemental firing (DB002). Dry low-NOx combustors (DLN02) and selective catalytic reduction (SCR02) will be used to control NOx emissions. An oxidation catalyst (OXC02) will be used to control CO and VOC emissions. Natural gas throughput rates based upon a heat content of 1,000 BTU/CF (HHV) and include both CT002 and DB002. Quantity per hour is based upon maximum hourly rate for all ambient conditions and quantity per year is based upon maximum hourly rate at ISO conditions for 8,760 hours per year.

Compliance Activity Description

Facility will maintain a NOx emission limit of 2.0 ppmv at 15 percent O2 (w/ and w/o duct burning) to satisfy LAER. This will be achieved through the application of DLN burners in combination with SCR. This limit applies at all load conditions except startup and shutdown. The facility will use CEMS to monitor NOx stack emissions.

Description

The facility will meet a LAER emission rate of 1.8 ppmvd at 15% O2 with duct firing and 0.7 ppmvd at 15% O2 without duct firing. The emission levels apply at all operating loads except during startup and shutdown. These emission levels will be achieved through good combustion practices and an oxidation catalyst. Stack testing for non-methane hydrocarbons will be conducted to demonstrate compliance with these limits.

Process Description

Natural gas firing of the GE 7F.05 combustion turbine (CT003) with and without supplemental firing (DB003. Dry low-NOx combustors (DLN03) and selective catalytic reduction (SCR03) will be used to control NOx emissions. An oxidation catalyst (OXC03) will be used to control CO and VOC emissions. Natural gas throughput rates based upon a heat content of 1,000 BTU/CF (HHV) and include both CT003 and DB003. Quantity per hour is based upon maximum hourly rate for all ambient conditions and quantity per year is based upon maximum hourly rate at ISO conditions for 8,760 hours per year.

Compliance Activity Description

Facility will maintain a NOx emission limit of 2.0 ppmv at 15 percent O2 (w/ and w/o duct burning) to satisfy LAER. This will be achieved through the application of DLN burners in combination with SCR. This limit applies at all load conditions except startup and shutdown. The facility will use CEMS to monitor NOx stack emissions.

Description

The turbines will meet a LAER emission rate of 2.0 ppmvd at 15% O2, with and without duct firing. The emission level applies at all operating loads except during startup and shutdown. LAER is more stringent than 227.2.4 and therefore satisfies this requirement.

Description

The facility will meet a LAER emission rate of 2.0 ppmvd at 15% O2, with and without duct firing. The emission levels apply at all operating loads except during startup and shutdown. LAER is more stringent than 40 CFR 60.4320 and therefore satisfies this requirement.

Facility will purchase a fire pump engine that will be certified to meet the federal emission standards under 40 CFR 60 Subpart IIII for the current model years. Thus the engine will maintain a NOx + HC emission rate of 3.0 g/hp-hr. Compliance with this limit is also considered LAER. Compliance will be demonstrated via certification by the vendor and adherence to vendor specified maintenance recommendations.

Compliance Activity Description

Facility will purchase an emergency generator engine that will be certified to meet the federal emission standards under 40 CFR 60 Subpart IIII for the current model years. Thus the engine will maintain a NOx + HC emission rate of 4.8 g/hp-hr in accordance with 40 CFR 60.4202(b)(2) and 40 CFR 89.112(a), Table 1. Compliance with these federal limits is also considered LAER. Compliance will be demonstrated via certification by the vendor and adherence to vendor specified maintenance recommendations.

List of Exempt Activities

Instructions

Applicants for Title V facility permits must provide a listing of each exempt activity, as described in 6 NYCRR Part 201-3.2(c), that is currently operated at the facility. This form provides a means to fulfill this requirement.

In order to complete this form, enter the number and building location of each exempt activity. Building IDs used on this form should match those used in the Title V permit application. If a listed activity is not operated at the facility, leave the corresponding information blank.

Combustion

Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(1)	Stationary or portable combustion installations where the furnace has a maximum heat input capacity less than 10 mmBtu/hr burning fuels other than coal or wood; or a maximum heat input capacity of less than 1 mmBtu/hr burning coal or wood. This activity does not include combustion installations burning any material classified as solid waste, as defined in 6 NYCRR Part 360, or waste oil, as defined in 6 NYCRR Subpart 225-2.		
(2)	Space heaters burning waste oil at automotive service facilities, as defined in 6 NYCRR Subpart 225-2, generated on-site or at a facility under common control, alone or in conjunction with used oil generated by a do-it-yourself oil changer as defined in 6 NYCRR Subpart 374-2.		
(3)(i)	Stationary or portable internal combustion engines that are liquid or gaseous fuel powered and located within the New York City metropolitan area or the Orange County towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick, or Woodbury, and have a maximum mechanical power rating of less than 200 brake horsepower.		
(3)(ii)	Stationary or portable internal combustion engines that are liquid or gaseous fuel powered and located outside of the New York City metropolitan area or the Orange County towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick, or Woodbury, and have a maximum mechanical power rating of less than 400 brake horsepower.		
(3)(iii)	Stationary or portable internal combustion engines that are gasoline powered and have a maximum mechanical power rating of less than 50 brake horsepower.		
(4)	Reserved.		
(5)	Gas turbines with a heat input at peak load less then 10 mmBtu/hour		

DEC ID
3 - 1 3 2 6 - 0 0 2 7 5

Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(6)	Emergency power generating stationary internal combustion engines, as defined in 6 NYCRR Part 200.1(cq), and engine test cells at engine manufacturing facilities that are utilized for research and development, reliability performance testing, or quality assurance performance testing. Stationary internal combustion engines used for peak shaving and/or demand response programs are not exempt.		
Combustion Related			
(7)	Non-contact water cooling towers and water treatment systems for process cooling water and other water containers designed to cool, store or otherwise handle water that has not been in direct contact with gaseous or liquid process streams.		
Agricultural			
(8)	Feed and grain milling, cleaning, conveying, drying and storage operations including grain storage silos, where such silos exhaust to an appropriate emissions control device, excluding grain terminal elevators with permanent storage capacities over 2.5 million U.S. bushels, and grain storage elevators with capacities above one million bushels.		
(9)	Equipment used exclusively to slaughter animals, but not including other equipment at slaughterhouses, such as rendering cookers, boilers, heating plants, incinerators, and electrical power generating equipment.		
Commercial - Food Service Industries			
(10)	Flour silos at bakeries, provided all such silos are exhausted through an appropriate emission control device.		
(11)	Emissions from flavorings added to a food product where such flavors are manually added to the product.		
Commercial - Graphic Arts			
(12)	Screen printing inks/coatings or adhesives which are applied by a hand-held squeegee. A hand-held squeegee is one that is not propelled though the use of mechanical conveyance and is not an integral part of the screen printing process.		
(13)	Graphic arts processes at facilities located outside the New York City metropolitan area or the Orange County towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick, or Woodbury whose facility-wide total emissions of volatile organic compounds from inks, coatings, adhesives, fountain solutions and cleaning solutions are less than three tons during any 12-month period.		

Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(14)	Graphic label and/or box labeling operations where the inks are applied by stamping or rolling.		
(15)	Graphic arts processes which are specifically exempted from regulation under 6 NYCRR Part 234, with respect to emissions of volatile organic compounds which are not given an A rating as described in 6 NYCRR Part 212.		
Commercial - Other			
(16)	Gasoline dispensing sites registered with the department pursuant to 6 NYCRR Part 612.		
(17)	Surface coating and related activities at facilities which use less than 25 gallons per month of total coating materials, or with actual volatile organic compound emissions of 1,000 pounds or less from coating materials in any 12-month period. Coating materials include all paints and paint components, other materials mixed with paints prior to application, and cleaning solvents, combined. This exemption is subject to the following: (i) The facility is located outside of the New York City metropolitan area or the Orange County towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick, or Woodbury; and (ii) All abrasive cleaning and surface coating operations are performed in an enclosed building where such operations are exhausted into appropriate emission control devices.		
(18)	Abrasive cleaning operations which exhaust to an appropriate emission control device.		
(19)	Ultraviolet curing operations.		
Municipal/Public Health Related			
(20)	Landfill gas ventilating systems at landfills with design capacities less than 2.5 million megagrams (3.3 million tons) and 2.5 million cubic meters (2.75 million cubic yards), where the systems are vented directly to the atmosphere, and the ventilating system has been required by, and is operating under, the conditions of a valid 6 NYCRR Part 360 permit, or order on consent.		
Storage Vessels			
(21)	Distillate fuel oil, residual fuel oil, and liquid asphalt storage tanks with storage capacities below 300,000 barrels.	2	

DEC ID
3 - 1 3 2 6 - 0 0 2 7 5

Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(22)	Pressurized fixed roof tanks which are capable of maintaining a working pressure at all times to prevent emissions of volatile organic compounds to the outdoor atmosphere.		
(23)	External floating roof tanks which are of welded construction and are equipped with a metallic-type shoe primary seal and a secondary seal from the top of the shoe seal to the tank wall.		
(24)	External floating roof tanks which are used for the storage of a petroleum or volatile organic liquid with a true vapor pressure less than 4.0 psi (27.6 kPa), are of welded construction and are equipped with one of the following: (i) a metallic-type shoe seal; (ii) a liquid-mounted foam seal; (iii) a liquid-mounted liquid-filled type seal; or (iv) equivalent control equipment or device.		
(25)	Storage tanks, including petroleum liquid storage tanks as defined in 6 NYCRR Part 229, with capacities less than 10,000 gallons, except those subject to 6 NYCRR Part 229 or Part 233.		
(26)	Horizontal petroleum or volatile organic liquid storage tanks.		
(27)	Storage silos storing solid materials, provided all such silos are exhausted through an appropriate emission control device. This exemption does not include raw material, clinker, or finished product storage silos at Portland cement plants.		
Industrial			
(28)	Processing equipment at existing sand and gravel and stone crushing plants which were installed or constructed before August 31, 1983, where water is used for operations such as wet conveying, separating, and washing. This exemption does not include processing equipment at existing sand and gravel and stone crushing plants where water is used for dust suppression.		
(29)(i)	Sand and gravel processing or crushed stone processing lines at a non-metallic mineral processing facility that are a permanent or fixed installation with a maximum rated processing capacity of 25 tons of minerals per hour or less.		

DEC ID
3 - 1 3 2 6 - 0 0 2 7 5

Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(29)(ii)	Sand and gravel processing or crushed stone processing lines at a non-metallic mineral processing facility that are a portable emission source with a maximum rated processing capacity of 150 tons of minerals per hour or less.		
(29)(iii)	Sand and gravel processing or crushed stone processing lines at a non-metallic mineral processing facility that are used exclusively to screen minerals at a facility where no crushing or grinding takes place.		
(30)	Reserved.		
(31)	Surface coating operations which are specifically exempted from regulation under 6 NYCRR Part 228, with respect to emissions of volatile organic compounds which are not given an A rating pursuant to 6 NYCRR Part 212.		
(32)	Pharmaceutical tablet branding operations.		
(33)	Thermal packaging operations, including, but not limited to, therimage labeling, blister packing, shrink wrapping, shrink banding, and carton gluing.		
(34)	Powder coating operations.		
(35)	All tumblers used for the cleaning and/or deburring of metal products without abrasive blasting.		
(36)	Presses used exclusively for molding or extruding plastics except where halogenated carbon compounds or hydrocarbon solvents are used as foaming agents.		
(37)	Concrete batch plants where the cement weigh hopper and all bulk storage silos are exhausted through fabric filters, and the batch drop point is controlled by a shroud or other emission control device.		
(38)	Cement storage operations not located at Portland cement plants where materials are transported by screw or bucket conveyors.		
(39)(i)	Cold cleaning degreasers with an open surface area of 11 square feet or less and an internal volume of 93 gallons or less or, having an organic solvent loss of 3 gallons per day or less.		
39(ii)	Cold cleaning degreasers that use a solvent with a VOC content or five percent or less by weight, unless subject to the requirements of 40 CFR 63 Subpart T.

(39)(iv)	Open-top vapor degreasers with an open-top area smaller than 11 square feet (1 square meter), unless subject to the requirements of 40 CFR 63 Subpart T.		
Miscellaneous			
(40)	Ventilating and exhaust systems for laboratory operations. Laboratory operations do not include processes having a primary purpose to produce commercial quantities of materials.		
(41)	Exhaust or ventilating systems for the melting of gold, silver, platinum and other precious metals.		
(42)	Exhaust systems for paint mixing, transfer, filling or sampling and/or paint storage rooms or cabinets, provided the paints stored within these locations are stored in closed containers when not in use.		
(43)	Exhaust systems for solvent transfer, filling or sampling, and/or solvent storage rooms provided the solvent stored within these locations are stored in containers when not in use.		
(44)	Research and development activities, including both stand-alone and activities within a major facility, until such time as the administrator completes a rule making to determine how the permitting program should be structured for these activities.		
(45)	The application of odor counteractants and/or neutralizers.		
(46)	Hydrogen fuel cells.		
(47)	Dry cleaning equipment that uses only water-based cleaning processes or those using liquid carbon dioxide.		
(48)	Manure spreading, handling and storage at farms and agricultural facilities.

Methods Used to Determine Compliance

Emission Unit ID	Permit Condition / Applicable Requirement	Method Used to Determine Compliance	Compliance Date
Facility Wide	Permit Condition 1, 6 NYCRR 200.6	An ambient air quality impact analysis was submitted with the application for Permit ID 3-1326-00275/00009 to demonstrate compliance with the applicable ambient air quality standards.	02/03/2016
Facility Wide	Permit Condition 2, 6 NYCRR 201-6.4 (a) (7)	CVEC has paid all fees consistent with the fee schedule authorized by ECL 72-0303.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 3, 6 NYCRR 201-6.4 (c)	CVEC includes the following information in any required compliance monitoring records and reports: (i) The date, place, and time of sampling or measurements; (ii) The date(s) analyses were performed; (iii)The company or entity that performed the analyses; (iv) The analytical techniques or methods used including quality assurance and quality control procedures if required; (v) The results of such analyses including quality assurance data where required; and (vi) The operating conditions as existing at the time of sampling or measurement. Any deviation from permit requirements is clearly identified in all records and reports. Reports are certified by a responsible official, consistent with Section 201-6.2 of Part 201.	As of the date of each monitoring record and report.

Methods Used to Determine Compliance

Emission Unit ID	Permit Condition / Applicable Requirement	Method Used to Determine Compliance	Compliance Date
Facility Wide	Permit Condition 4, 6 NYCRR 201-6.4 (c) (2)	Compliance monitoring and recordkeeping is conducted according to the terms and conditions contained in Permit ID 3-1326-00275/00009 and follows all quality assurance requirements found in applicable regulations. Records of all monitoring data and support information are retained for a period of at least 5 years from the date of the monitoring, sampling, measurement, report, or application. All supporting information including all calibration and maintenance records and all original data recordings for continuous monitoring instrumentation, and copies of all reports as required by the permit.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 5, 6 NYCRR 201-6.4 (c) (3) (ii)	CVEC submits a compliance monitoring report every 6 months no later than each January 30th and July 30th and contains all information required under 6 NYCRR 201-6.4 (c). Each report identifies all instances of deviations from permit requirements and are certified by the responsible official. The reports state the probable cause of any deviations and any corrective actions or preventive measures taken. Deviation reports are submitted in accordance with the time frame of the applicable requirement or the time frame under Permit Condition 5, Item 5.2, as applicable.	As of the date of the most recent report.

Methods Used to Determine Compliance

Emission Unit ID	Permit Condition / Applicable Requirement	Method Used to Determine Compliance	Compliance Date
Facility Wide	Permit Condition 6, 6 NYCRR 201-6.4 (e)	CVEC submits an annual compliance certification report no later than each January 30th and contains all information required under 6 NYCRR 201-6.4 (e) and Permit Condition 6, Item 6.2.	As of the date of the most recent compliance certification report.
Facility Wide	Permit Condition 7, 6 NYCRR 202-2.1	CVEC submits an annual emission statement by no later than April 15th each year.	As of the date of the most recent emission statement report.
Facility Wide	Permit Condition 8, 6 NYCRR 202-2.5	CVEC maintains the following records at the facility and these will be made available to representatives of the department upon request during normal business hours. These records will be maintained for at least five years. (1) a copy of each emission statement submitted to the department; and (2) records indicating how the information submitted in the emission statement was determined, including any calculations, data, measurements, and estimates used.	As of the date of the most recent emission statement report.
Facility Wide	Permit Condition 9, 6 NYCRR 215.2	Except as allowed by Title 6 NYCRR Section 215.3, no person shall burn, cause, suffer, allow or permit the burning of any materials in an open fire. CVEC does no allow open fires at the facility.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 10, 6 NYCRR 200.7	CVEC operates and maintains all emission control equipment on emission units U-00001, U-00002, and U-00003 in accordance with industry practices, standards and procedures, inclusive of manufacturer's specifications.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 11, 6 NYCRR 201-1.7	CVEC does not operate any air cleaning devices that collect air contaminants and therefore this requirement is not applicable.	Not Applicable
Facility Wide	Permit Condition 12, 6 NYCRR 201-1.8	CVEC does not operate any air cleaning devices that collect air contaminants and therefore this requirement is not applicable.	Not Applicable
Facility Wide	Permit Condition 13, 6 NYCRR 201-3.2 (a)	CVEC certifies that all Exempt Activities identified in this application are operated and meet the specific criteria for exemption. Records will be maintained on-site for 5 years to verify compliance.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 14, 6 NYCRR 201-3.3 (a)	CVEC certifies that all Trivial Activities, as defined under NYCRR identified in 6 NYCRR 201-3.3 (c), that are performed at the facility meet the specific criteria for a Trivial Activity. Records will be maintained on-site for 5 years to verify compliance.	As of the date of certification of this renewal application.

Methods Used to Determine Compliance

Emission Unit ID	Permit Condition / Applicable Requirement	Method Used to Determine Compliance	Compliance Date
Facility Wide	Permit Condition 15, 6 NYCRR 201-6.4 (a) (4)	CVEC will upon request furnish to the department in a reasonable time any information that the department may request in writing to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit or to determine compliance with the permit. CVEC will also furnish to the department copies of records required to be kept by the permit or, for information claimed to be confidential, the permittee may furnish such records directly to the administrator along with a claim of confidentiality, if the administrator initiated the request for information or otherwise has need of it.	As of the date of certification of this renewal application, the department has not requested any information of this nature.
Facility Wide	Permit Condition 16, 6 NYCRR 201-6.4 (a) (8)	CVEC shall allow the department or an authorized representative to: (i) enter upon the premises or where permit records are kept; (ii) have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit; (iii) inspect at reasonable times any emission sources, equipment (including monitoring and air pollution control equipment), practices, and operations regulated or required under the permit; and (iv) sample or monitor at reasonable times substances or parameters for the purpose of assuring compliance with the permit or applicable requirements.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 17, 6 NYCRR 201-6.4 (f) (6)	CVEC will provide written notice a minimum of seven days in advance of any changes that contravene an express permit term, provided that such changes would not violate applicable requirements and are not a modification.	CVEC has not made any changes meeting these criteria.
Facility Wide	Permit Condition 18, 6 NYCRR 202-1.1	CVEC will complete emissions testing requested by the department for the purposes of demonstrating compliance with an applicable requirement.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 19, 40 CFR Part 68	CVEC does not have a chemical listed in Tables 1,2,3 or 4 of 40 CFR §68.130 at a quantity greater than the threshold quantity listed in Tables 1,2,3 or 4,	Not Applicable
Facility Wide	Permit Condition 20, 40 CFR 82, Subpart F	CVEC complies with all applicable provisions of 40 CFR Part 82.	As of the date of certification of this renewal application.
Emission Units U-00004 and U-00005	Permit Condition 1-2, 6 NYCRR 200.1 (cq)	The emergency generator and the emergency fire pump engine have been operated less than 500 hours of operation per year per engine, rolled monthly, and CVEC maintains records on site tracking the hours of operation, rolling the hours monthly.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 22, 6 NYCRR 200.7	CVEC maintains records to verify concentration of ammonia stored on-site is equal to or less than 19% by weight. Records of vendor certifications or analyses per delivery are used to verify concentration.	As of the date of certification of this renewal application.
Emission Units U-00001, U-00002, and U-00003	Permit Condition 23, 6 NYCRR 200.7	CVEC operates continuous emissions monitoring systems (CEMS) to verify that the ammonia concentration in the exhaust is 5.0 parts per million by volume dry basis corrected to 15% oxygen (ppmvdc) during all turbine loads, all fuels being fired, and all duct burner operations. Reports of the CEMS data are submitted quarterly.	As of the date of certification of this renewal application.

Methods Used to Determine Compliance

Emission Unit ID	Permit Condition / Applicable Requirement	Method Used to Determine Compliance	Compliance Date
Emission Units U-00001, U-00002, and U-00003	Permit Condition 24, 6 NYCRR 201-1.4 (a)	CVEC monitors all occurrences of start-up and shut-down from the combustion turbines including duration of start-up and shut-down and total pounds of emissions of NOx, CO and NH3 monitored by a CEMS. The facility recorded its 15th startup and 15th shutdown on approximately March 22, 2020 and submitted a letter on May 20, 2020 with proposed start-up and shut-down limits to the Department for approval.	May 20, 2020
Emission Unit U-00001	Permit Condition 25, Item 25.1. 6 NYCRR 201-6	This emission unit consists of one natural gas fired GE Model 7F.05 combustion turbine generator (CTG), one heat recovery steam generator (HRSG) with supplemental natural gas firing, and one natural gas fired auxiliary boiler. The CTG, HRSG, and auxiliary boiler are exhausted through a common stack.	As of the date of certification of this renewal application.
Emission Unit U-00002	Permit Condition 25, Item 25.2. 6 NYCRR 201-6	This emission unit consists of one natural gas fired GE Model 7F.05 CTG and one HRSG with supplemental natural gas firing exhausted through a common stack.	As of the date of certification of this renewal application.
Emission Unit U-00003	Permit Condition 25, Item 25.3. 6 NYCRR 201-6	This emission unit consists of one natural gas fired GE Model 7F.05 CTG and one HRSG with supplemental natural gas firing exhausted through a common stack.	As of the date of certification of this renewal application.
Emission Unit U-00004	Permit Condition 25, Item 25.4. 6 NYCRR 201-6	This emission unit consists of one 260 horsepower emergency diesel-fired fire pump engine.	As of the date of certification of this renewal application.
Emission Unit U-00005	Permit Condition 25, Item 25.5. 6 NYCRR 201-6	This emission unit consists of one 1,500 kW electrical (1,645 mechanical) diesel fired emergency generator engine.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 26, 6 NYCRR 201-6.4(d)(4)	CVEC is not subject to any schedule of compliance and therefore semi-annual compliance reports are not required.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 27, 6 NYCRR 202-1.2	No less than 30 days prior to an emission test required by applicable requirement or requested by the department, CVEC will submit written notification to the department of the time and date of the test, the acceptable procedures to be used to stack test, including sampling and analytical procedures. CVEC will allow the commissioner, or his representative, free access to observe the stack testing identified in the notification.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 28, 6 NYCRR 202-2.3	All emission statements required by Permit Condition 7 and 6 NYCRR 202-2.1 will include all information listed in Item 28.1 of Permit Condition 28.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 29, 6 NYCRR 202-2.4	All emission statements required by Permit Condition 7 and 6 NYCRR 202-2.1 will by submitted no later than April 30th each year and include all information listed in Item 29.1 of Permit Condition 29.	As of the date of certification of this renewal application.

Methods Used to Determine Compliance

Emission Unit ID	Permit Condition / Applicable Requirement	Method Used to Determine Compliance	Compliance Date
Facility Wide	Permit Condition 30, 6 NYCRR 211.1	CVEC will not cause or allow emissions of air contaminants to the outdoor atmosphere of such quantity, characteristic or duration which are injurious to human, plant or animal life or to property, or which unreasonably interfere with the comfortable enjoyment of life or property. Notwithstanding the existence of specific air quality standards or emission limits, this prohibition applies, but is not limited to, any particulate, fume, gas, mist, odor, smoke, vapor, pollen, toxic or deleterious emission, either alone or in combination with others.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 31, 6 NYCRR 225-1.2 (g)	CVEC will only fire distillate oil with a sulfur content no greater than 0.0015 percent sulfur in any stationary combustion installation at the facility. Records of vendor certifications or analyses per delivery are used to verify concentration.	As of the date of certification of this renewal application.
Facility Wide	Permit Condition 32, 6 NYCRR 225-1.2 (h)	CVEC will only fire distillate oil with a sulfur content no greater than 0.0015 percent sulfur in any stationary combustion installation at the facility. Records of vendor certifications or analyses per delivery are used to verify concentration.	As of the date of certification of this renewal application.
Emission Units U-00004 and U-00005	Permit Condition 1-3, 6 NYCRR 227-1.3	The emergency fire pump engine and emergency generator engine are operated and maintained in accordance with manufacturer specifications to ensure that emissions of opacity do not exceed 20 percent opacity (six minute average), except for one six-minute period per hour of not more than 27 percent opacity. When the emergency generator and fire pump engine are operating, their stacks are observed to ensure that visible emissions do not exceed the limit. CVEC will take corrective actions, as necessary, and will record and maintain these corrective actions on site for Department review.	No corrective actions have been required as of the date of certification of this renewal application.
Emission Units U-00001, U-00002, and U-00003	Permit Condition 1-4, 6 NYCRR 227-1.3(a)	CVEC operates the CTGs, duct burners, and auxiliary boiler to ensure that emissions of opacity do not exceed 20 percent opacity (six minute average), except for one six-minute period per hour of not more than 27 percent opacity. The facility shall conduct performance tests on the combustion turbines, associated duct burners, and the auxiliary boiler operating in conjunction to verify compliance.	Performance tests were completed on 03/06/20 (U-00001), 03/11/20 (U-00002), and 04/17/20 (U-00003) and verified compliance with the applicable opacity limits
Facility Wide	Permit Condition 1-5, 6 NYCRR 231-5.3	The facility maintains rolling 12-month records from emission units U-00001, U-00002, U-00003, U-00004, and U-00005 to verify that facility-wide emissions of NOx and VOC are no greater than 251.4 tons per year (tpy) and 95.4 tpy, respectively.	As of the date of certification of this renewal application.
Emission Unit U-00001	Permit Condition 1-6, 6 NYCRR 231-5.4	CVEC maintains a NOx emission limit of 2.0 ppmvdc (with and without duct burning) to satisfy LAER. Emissions are controlled through the application of DLN burners in combination with Selective Catalytic Reduction (SCR). This limit applies at all load conditions except start-up and shutdown. CVEC operates CEMS to verify compliance with the NOx emissions limit.	As of the date of certification of this renewal application.

Methods Used to Determine Compliance

Emission Unit ID	Permit Condition / Applicable Requirement	Method Used to Determine Compliance	Compliance Date
Emission Units U-00001, U-00002, and U-00003	Permit Condition 36, 6 NYCRR 231-5.4	To satisfy LAER requirements, CVEC operates each CTG and associated duct burner to limit the VOC emission rate to no greater than of 0.7 ppmvdc, without duct firing. This emission limit applies at all operating loads, except during startup and shutdown, and is achieved through good combustion practices and an oxidation catalyst. Stack testing will be conducted to demonstrate compliance with these limits.	Performance tests were completed on 03/06/20 (U-00001), 03/11/20 (U-00002), and 04/17/20 (U-00003) and verified compliance with the applicable VOC limit.
Emission Units U-00001, U-00002, and U-00003	Permit Condition 37, 6 NYCRR 231-5.4	To satisfy LAER requirements, CVEC operates each CTG and associated duct burner to limit the VOC emission rate to no greater than of 1.8 ppmvdc, with duct firing. This emission limit applies at all operating loads, except during startup and shutdown, and is achieved through good combustion practices and an oxidation catalyst. Stack testing will be conducted to demonstrate compliance with these limits.	Performance tests were completed on 03/06/20 (U-00001), 03/11/20 (U-00002), and 04/17/20 (U-00003) and verified compliance with the applicable VOC limit.
Facility Wide	Permit Condition 1-7, 6 NYCRR 231-5.5	CVEC obtained 136 tons of VOC emission reduction credits in accordance with Part 231-5.2(d) from the 3M Bristol facility (PA_DEC ID#: PADEP 09-00005) to offset the facility's potential to emit VOCs of 95.4 tons per year at a ratio of 1.15 to 1.	Completed and verified prior to issuance of the Title V permit on 02/03/16.
Facility Wide	Permit Condition 1-8, 6 NYCRR 231-5.5	CVEC obtained 322.11 tons of NOx emission reduction credits in accordance with Part 231-5.2(d) from these facilities: Norbord Industries, Inc. DEC ID# 4-1230-00019, 178.24 tpy; Georgia-Pacific Consumer Operations LLC, DEC ID# 5-0913-00004, 142.87 tpy; and EastRiver Housing Corporation, DEC ID# 2-6206-00096, 1.0 tpy. These offset the facility's potential to emit NOx of 251.4 tons per year at a ratio of 1.15 to 1.	Completed and verified prior to issuance of the Title V permit on 02/03/16.
Facility Wide	Permit Condition 1-9, 6 NYCRR 231-7.5	CVEC operates Emission Units U-00001, U-00002, U-00003, U-00004 and U-00005 to limit Facility-wide PTE to 296.3 tpy of CO, 174.1 tpy of PM2.5, 174.1 tpy of PM10, 19.7 tpy of H2SO4, and 3,593,609 tpy CO2e to satisfy BACT. Records of monthly and rolling 12-month emissions are kept to verify compliance.	As of the date of certification of this renewal application.
Emission Unit U-00004	Permit Condition 1-10, 6 NYCRR 231-7.6	CVEC maintain records of monthly and rolling 12-month operating hours to verify compliance with the emergency fire pump engine greenhouse gas emissions limit of 74 tpy. Monthly and rolling 12-month emissions are calculated based upon operating hours, the rated firing rate of the engine, and the emission factors published in 40 CFR Part 98, Subpart C, Tables C-1 and C-2 for CO2 and CH4/N2O, respectively and the global warming potentials published in in 40 CFR Part 98, Subpart A, Table A-1. Emission Unit U-00005	Permit Condition 1-12, 6 NYCRR 231-7.6	CVEC maintain records of diesel sulfur content at or below 0.0015 percent to verify compliance with the emergency generator engine sulfuric acid emissions limit of 0.0001 lb/MMBtu. Fuel sulfur records are kept in accordance with Permit Conditions 31 and 32.	As of the date of certification of this renewal application.
Emission Unit U-00004	Permit Condition 1-13, 6 NYCRR 231-7.6	CVEC maintain records of diesel sulfur content at or below 0.0015 percent to verify compliance with the emergency fire pump engine sulfuric acid emissions limit of 0.0001 lb/MMBtu. Fuel sulfur records are kept in accordance with Permit Conditions 31 and 32. This application requests a correction of the permit language for Condition 1-13 as the current language is redundant with Condition 42 and does not reflect firing of diesel fuel in U-00004.	As of the date of certification of this renewal application.
Emission Units U-00001, U-00002, and U-00003	Permit Condition 42, 6 NYCRR 231-7.6	CVEC maintain records of natural sulfur content at or below 0.4 grains per 100 dry standard cubic feet of natural gas to verify compliance with the combustion turbine sulfuric acid emissions limit of 0.00065 lb/MMBtu. Fuel sulfur records are kept in accordance with 40 CFR 75, App. D, Sect. 2.3 and through certification or analysis provided by the natural gas supplier.	As of the date of certification of this renewal application.
Emission Units U-00001, U-00002, and U-00003	Permit Condition 43, 6 NYCRR 231-7.6	CVEC completed performance testing within 180 days of startup that verified compliance with the sulfuric acid emissions limit of 0.00065 lb/MMBtu for each emission unit.	Performance tests were completed on 03/06/20 (U-00001), 03/11/20 (U-00002), and 04/17/20 (U-00003) and verified compliance with the applicable sulfuric acid limit.
Emission Units U-00001, U-00002, and U-00003	Permit Condition 44, 6 NYCRR 231-7.6	CVEC completed performance testing within 180 days of startup that verified compliance with the particulate emission rate limit of 0.006 lb/mmBtu, with duct firing, for each emission unit.	Performance tests were completed on 03/06/20 (U-00001), 03/11/20 (U-00002), and 04/17/20 (U-00003) and verified compliance with the applicable sulfuric acid limit.

Emission Units U-00001, U-00002, and U-00003	Permit Condition 50, 40 CFR 60.7(b), Subpart A	CVEC maintains records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of the combined cycle combustion turbines and auxiliary boiler; any malfunction of the air pollution control equipment; and periods during which a CEMS or monitoring device is inoperative.	As of the date of certification of this renewal application.
Emission Units U-00001, U-00002, and U-00003	Permit Condition 51, 40 CFR 60.7(f), Subpart A	CVEC will keep records of all measurements, including CEMS, monitoring devices, and performance testing measurements; all CEMS performance evaluations; all continuous monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by this part, recorded in permanent form suitable for inspections. CVEC shall maintain these records for at least two years following the date of such measurements, reports, and records.	As of the date of certification of this renewal application.
Emission Units U-00001, U-00002, and U-00003	Permit Condition 52, 40 CFR 60.8(b), Subpart A	All performance testing that has been conducted on the combustion turbines and duct burners was completed in accordance with a pretest protocol submitted to the Administrator in advance of the testing, which defined the methods and procedures prescribed in 40 CFR 60 Subparts A and KKKK.	The pretest protocol is dated 06/24/2019
Emission Units U-00001, U-00002, and U-00003	Permit Condition 53, 40 CFR 60.8(d), Subpart A	CVEC notified the Administrator by letter more than 30 days in advance of the performance testing that has been conducted on the combustion turbines and duct burners.	Test notification dated 09/30/2019
Emission Units U-00001, U-00002, and U-00003	Permit Condition 54, 40 CFR 60.8(e), Subpart A	The exhaust stacks on Emission Units U-00001, U-00002, and U-00003 are equipped with sampling ports adequate for applicable test methods; a safe sampling platform; safe access to the sampling platform; and utilities for sampling and testing equipment.	Initial performance testing completed on 03/06/20 (U-00001), 03/11/20 (U-00002), and 04/17/20 (U-00003)
Emission Units U-00001, U-00002, and U-00003	Permit Condition 55, 40 CFR 60.8(f), Subpart A	The initial performance testing for NOx emissions from the combustion turbines and duct burners consisted of three separate 1-hour test runs.	Initial performance testing completed on 03/06/20 (U-00001), 03/11/20 (U-00002), and 04/17/20 (U-00003)
Emission Units U-00001, U-00002, and U-00003	Permit Condition 56, 40 CFR 60.13, Subpart A	The NOx CEMS installed on the combustion turbines and duct burners are installed, calibrated, maintained, and operated in accordance with the requirements of section 60.13.	Initial CEMS performance testing completed on 03/06/20 (U-00001), 03/11/20 (U-00002), and 04/17/20 (U-00003)
Emission Units U-00004 and U-00005	Permit Condition 1-14, 40 CFR 60, Subpart IIII	CVEC installed, operates, and maintains the emergency fire pump engine and emergency generator engine in accordance with 40 CFR 60, Subpart IIII.	As of the date of certification of this renewal application.

Emission Unit U-00005	Permit Condition 1-15, 40 CFR 60.4205(b), Subpart IIII	The emergency generator engine has been certified by the manufacturer to meet the federal emission standards under 40 CFR 60 Subpart IIII for the current model years. Thus, the engine will maintain a PM emission rate of 0.15 g/hp-hr in accordance with 40 CFR 60.4202(b)(2) and 40 CFR 89.112(a), Table 1. Compliance with these federal limits is also considered BACT. Compliance is demonstrated via certification by the vendor and adherence to vendor specified maintenance recommendations.	Certificate Number HCPXL78.1NZS-016 issued by USEPA to Caterpillar Inc. on 07/29/2016.
Emission Unit U-00005	Permit Condition 1-16, 40 CFR 60.4205(b), Subpart IIII	The emergency generator engine has been certified by the manufacturer to meet the federal emission standards under 40 CFR 60 Subpart IIII for the current model years. Thus, the engine will maintain a NOx + HC emission rate of 4.8 g/hp-hr in accordance with 40 CFR 60.4202(b)(2) and 40 CFR 89.112(a), Table 1. Compliance with these federal limits is also considered LAER. Compliance is demonstrated via certification by the vendor and adherence to vendor specified maintenance recommendations.	Certificate Number HCPXL78.1NZS-016 issued by USEPA to Caterpillar Inc. on 07/29/2016.
Emission Unit U-00005	Permit Condition 1-17, 40 CFR 60.4205(b), Subpart IIII	The emergency generator engine has been certified by the manufacturer to meet the federal emission standards under 40 CFR 60 Subpart IIII for the current model years. Thus, the engine will maintain a CO emission rate of 2.6 g/hp-hr in accordance with 40 CFR 60.4202(b)(2) and 40 CFR 89.112(a), Table 1. Compliance with these federal limits is also considered BACT. Compliance is demonstrated via certification by the vendor and adherence to vendor specified maintenance recommendations. Thus, the engine will maintain a particulate matter emission rate of 0.15 g/hp-hr in accordance with Table 4 of 40 CFR 60, Subpart IIII. Compliance with these federal limits is also considered BACT. Compliance is demonstrated via certification by the vendor and adherence to vendor specified maintenance recommendations.	Certificate Number HJDXL13.5103-011 issued by USEPA to Deere & Company on 08/04/2016.
Emission Unit U-00005	Permit Condition 1-23, 40 CFR 60.4207(b), Subpart IIII	The emergency generator engine meets an SO2 emission limit of 0.0015 lb/MMBtu by only combusting diesel fuel with a maximum sulfur content of 0.0015 percent sulfur by weight in accordance with 40 CFR 80.510(b)(1)(i). Records of vendor certifications or analyses per diesel delivery are used to verify sulfur concentration.	As of the date of certification of this renewal application.
Emission Unit U-00004	Permit Condition 1-24, 40 CFR 60.4207(b), Subpart IIII	The emergency generator engine meets an SO2 emission limit of 0.0015 lb/MMBtu by only combusting diesel fuel with a maximum sulfur content of 0.0015 percent sulfur by weight in accordance with 40 CFR 80.510(b)(1)(i). Records of vendor certifications or analyses per diesel delivery are used to verify sulfur concentration.	As of the date of certification of this renewal application.
Emission Units U-00004 and U-00005	Permit Condition 59, 40 CFR 60.4211(a), Subpart IIII	CVEC complies with the emission standards specified in 40 CFR 60 Subpart IIII and does all of the following: (1) Operate and maintain the stationary CI internal combustion engine and control device according to the manufacturer's emission-related written instructions; (2) Change only those emission-related settings that are permitted by the manufacturer; and (3) Meet the requirements of 40 CFR parts 89, 94 and/or 1068, as they apply.	As of the date of certification of this renewal application.
Emission Units U-00004 and U-00005	Permit Condition 60, 40 CFR 60.4211(c), Subpart IIII	The emergency generator engine complies with the emission standards specified in §60.4205(b) and the emergency fire pump engine complies with the emission standards specified in §60.4205(c). Certificate Numbers HCPXL78.1NZS-016 and HCPXL78.1NZS-016 were issued by the USEPA for the emergency generator engine and emergency fire pump engine, respectively, to certify compliance with the applicable standards. The engines are installed and configured according to the manufacturer's specifications. CVEC provided a copy of the manufacturer's certification of compliance with the emission standards specified in 40 CFR 60 Subpart IIII with the application submitted in January 2018 for Modification 2 of Permit ID 3-1326-00275/00009 issued on March 23, 2018. Emission Unit U-00001	Permit Condition 66, Item 66.2, 6 NYCRR 201-6	Process P02 is comprised of a natural gas fired auxiliary with hours of operation limited to 4500 hours per year, which equates to 270 million cubic feet of natural gas consumption per year. Emission Source/Control: AUX01 – Combustion Design Capacity: 60 million Btu per hour; FGR01 - Control Type: FLUE GAS RECIRCULATION; and LNB01 –Control Type: LOW NOx BURNER as described in detail on the application forms.	As of the date of certification of this renewal application.
Emission Unit U-00002	Permit Condition 66, Item 66.3, 6 NYCRR 201-6	Process P04 is comprised of natural gas combustion in the combustion turbine and the duct burner. Emission Source/Control: CT002 – Combustion Design Capacity: 2,395.7 million Btu per hour; DB002 – Combustion Design Capacity: 247 million Btu per hour; DLN02 – Control Type: DRY LOW NOx BURNER; OXC02 –Control Type: CATALYTIC OXIDATION; and SCR02 – Control Type: SELECTIVE CATALYTIC REDUCTION (SCR) as described in detail on the application forms.	As of the date of certification of this renewal application.
Emission Unit U-00003	Permit Condition 66, Item 66.4, 6 NYCRR 201-6	Process P05 is comprised of natural gas combustion in the combustion turbine and the duct burner. Emission Source/Control: CT003 – Combustion Design Capacity: 2,395.7 million Btu per hour; DB003 – Combustion Design Capacity: 247 million Btu per hour; DLN03 – Control Type: DRY LOW NOx BURNER; OXC03 –Control Type: CATALYTIC OXIDATION; and SCR03 – Control Type: SELECTIVE CATALYTIC REDUCTION (SCR) as described in detail on the application forms.	As of the date of certification of this renewal application.
Emission Unit U-00004	Permit Condition 66, Item 66.5, 6 NYCRR 201-6	Process P06 is comprised of diesel oil combustion in an emergency fire pump engine rated at 260 hp with operation limited to no more than 500 hours per year. Emission Source/Control: FP001 – Combustion Design Capacity: 260 horsepower (mechanical) as described in detail on the application forms.	As of the date of certification of this renewal application.
Emission Unit U-00005	Permit Condition 66, Item 66.6, 6 NYCRR 201-6	Process P07 is comprised of diesel oil combustion in an emergency generator engine rated at 2,206 hp with operation limited to no more than 500 hours per year. Emission Source/Control: FP001 – Combustion Design Capacity: 2206 horsepower (mechanical) as described in detail on the application forms.	As of the date of certification of this renewal application.
Emission Unit U-00001	Permit Condition 67, 6 NYCRR 231-5.4	CVEC operates Process P02, the auxiliary boiler, no more than 4,500 hours per rolling 12 month period. CVEC maintains records of hourly operation and natural gas consumption.	As of the date of certification of this renewal application.
Emission Unit U-00001	Permit Condition 68, 6 NYCRR 231-5.4	To satisfy LAER requirements, CVEC operates Process P02, the auxiliary boiler, to limit the VOC emission rate to no greater than 0.0015 lb/mmBtu. This emission limit applies at all operating loads, except during startup and shutdown, and is achieved through good combustion practices. Stack testing will be conducted to demonstrate compliance with these limits.	Performance test completed on 10/04/19 and verified compliance with the applicable VOC limit.

Methods Used to Determine Compliance

Emission Unit ID	Permit Condition / Applicable Requirement	Method Used to Determine Compliance	Compliance Date
Emission Unit U-00001	Permit Condition 69, 6 NYCRR 231-5.4	To satisfy LAER requirements, CVEC operates Process P02, the auxiliary boiler, to limit the NOx emission rate to no greater than 0.0085 lb/mmBtu. This emission limit applies at all operating loads, except during startup and shutdown, and is achieved through good combustion practices. Stack testing will be conducted to demonstrate compliance with these limits.	Performance test completed on 10/04/19 and verified compliance with the applicable NOx limit.
Emission Unit U-00001	Permit Condition 70, 6 NYCRR 231-7.6	To satisfy BACT requirements for P02, only pipeline quality natural gas with a maximum sulfur content of 0.4 grains/100 dscf will be fired in the auxiliary boiler. The natural gas fired in P02 is the same as the gas fired in P01 and compliance will be demonstrated through the records maintained for Permit Condition 42.	As of the date of certification of this renewal application.
Emission Unit U-00001	Permit Condition 71, 6 NYCRR 231-7.6	To satisfy BACT requirements for P02, only pipeline quality natural gas with a maximum sulfur content of 0.4 grains/100 dscf will be fired in the auxiliary boiler to limit sulfuric acid emissions to no more than 0.00011 lb/mmBtu. The natural gas fired in P02 is the same as the gas fired in P01 and compliance will be demonstrated through the records maintained for Permit Condition 42.	As of the date of certification of this renewal application.
Emission Unit U-00001	Permit Condition 72, 6 NYCRR 231-7.6	To satisfy BACT requirements, CVEC operates Process P02, the auxiliary boiler, to limit the particulate emission rate to no greater than 0.005 lb/mmBtu. This emission limit is achieved through good combustion practices and by firing pipeline quality natural gas as the sole fuel. Stack testing will be conducted to demonstrate compliance with these limits.	Performance test completed on 10/04/19 and verified compliance with the applicable particulate limit.
Emission Unit U-00001	Permit Condition 73, 6 NYCRR 231-7.6	To satisfy BACT requirements, CVEC operates Process P02, the auxiliary boiler, to limit the CO emission rate to no greater than 0.0375 lb/mmBtu. This emission limit is achieved through good combustion practices. Stack testing will be conducted to demonstrate compliance with these limits.	Performance test completed on 10/04/19 and verified compliance with the applicable particulate limit.
Emission Unit U-00001	Permit Condition 74, 6 NYCRR 231-7.6	To satisfy BACT and 6 NYCRR Part 251.3(a) requirements, CVEC operates Process P02, the auxiliary boiler, to limit the greenhouse gas emission rate to no greater than 119 lb/mmBtu. This emission limit is achieved through firing pipeline quality natural gas as the sole fuel and reporting emissions in accordance with 40 CFR 98, Subpart C.	As of the date of certification of this renewal application.
Emission Unit U-00001	Permit Condition 75, 40 CFR 60.48c(a)	CVEC submitted the following notifications for P02, the auxiliary boiler. The notifications includes all required information listed under 40 CFR 60.48c(a)(1) through (3): • date of construction: submitted 10/17/2018 • date of actual startup: submitted 08/29/2019	See description.
Emission Unit U-00001	Permit Condition 76, 40 CFR 60.48c(g)(2)	CVEC records the amount of natural gas fired in P02, the auxiliary boiler, on a monthly basis.	As of the date of certification of this renewal application.

APPENDIX G: PROPOSED CTG STARTUP AND SHUTDOWN LIMITS

PROPOSED DEFINITIONS AND EMISSION LIMITS FOR STARTUP, SHUTDOWN, AND TUNING
EMISSION UNITS U-00001, U-00002, and U-00003

As required by Condition 24 of the Permit, the Facility has submitted proposed startup and shutdown limits for the three combustion turbines at the facility, emission units U-00001, U-00002, and U-00003.

Condition 24 requires the Facility to monitor all occurrences of startup and shutdown from the combustion turbines, including the duration of each startup and shutdown event, and the total pounds of emissions of NO_X, CO, and NH_3 during each startup and shutdown event, as measured and recorded by the CEMS for each combustion turbine.

Condition 24 also requires the Facility to submit proposed startup and shutdown limits to the Department within 60 days of recording the 15th startup and shutdown. The facility recorded its 15th startup and 15th shutdown on approximately March 22, 2020. Only startup and shutdown events that occurred after the date that each combustion turbine completed its initial performance tests and initial CEMS certification tests were used in determining when the 15th startup and shutdown event occurred.

Initial proposed limits were submitted to NYSDEC by email on May 20, 2020, based on actual startup and shutdown data through April 30, 2020. NYSDEC has agreed that the Facility may submit revisions to the proposed startup and shutdown limits as part of the Title V permit renewal application.

Analysis

The proposed startup and shutdown limits are based on actual operating and emissions data for a total of 131 startup events and 121 shutdown events, occurring between February 21 and June 30, 2020. A total of 12 startup events that exceeded the vendor-estimated duration of 60 minutes were excluded from the analysis. A total of seven shutdown events that exceeded the vendor-estimated duration of 20 minutes were also excluded from the analysis. A Microsoft Excel® workbook is being provided to NYSDEC in electronic format. The workbook contains the data evaluated and the calculations performed. A table summarizing the results the analysis is included with this appendix.

The Facility is proposing NO_x and CO mass emission limits in units of pounds emitted per event for each startup and shutdown, based on a review of actual CEMS data. The Facility is requesting that a single set of startup emission limits be considered for the purpose of simplifying recordkeeping and reporting, rather than different emission limits assigned specifically to cold, warm, and hot starts.

The Facility also proposes that NH_3 emission limits during startup and shutdown be similarly expressed in units of pounds emitted per event, based on a review of actual CEMS data, with a conservative margin applied based on engineering judgment. The Facility notes that, during startup periods when ammonia is injected while the catalyst is coming up to operating temperature, the measured NH_3 concentration is out-of-range of the instrument scale. For the purposes of performing this analysis, we assumed these out-of-range concentrations were 30 ppmvd based on an instrument scale of 20 ppmvd. To ensure no conflicts in the permit conditions, we are also requesting clarification of Item 23.2 of the existing permit to exclude startup and shutdown periods (see below).

Proposed Definitions and Emission Limits during Startup, Shutdown, and Tuning

We propose the following definitions and emission limits be added as compliance certification conditions for the following emission units and their respective processes:

Emission Unit: U-00001
Process: P01

Emission Unit: U-00002
Process: P04

Emission Unit: U-00003
Process: P05

Below are the proposed monitoring descriptions for each condition or emission limit related to startup, shutdown, and tuning.

Startup duration

Startup is defined as the period of time from when a "FLAME ON" signal is received from the Distributed Control System (DCS) until steady-state operation is attained as identified by 10 consecutive minutes of compliance with steady-state CO and NO_X emission limits. The duration of a startup shall not exceed 60 minutes.

The initial application for the Permit was based upon a maximum startup duration of 60 minutes. However, the Facility has experienced several startup events on all three units longer than 60 minutes since the Facility has achieved commercial operation. CVEC is reviewing startup procedures with GE to make every effort to limit startup duration to less than 60 minutes. However, CVEC does not want to propose a permit limit that cannot be met consistently. Therefore, CVEC reserves the right to propose a startup duration longer than 60 minutes pending the outcome of the review of startup procedures with GE. Should CVEC determine that a longer startup time is necessary, we will provide NYSDEC with a detailed analysis to document why the longer duration is necessary with supporting documentation from GE.

The owner or operator shall record the date and time of each startup event. A report consisting of the recorded information shall be submitted to the Department with the facility's required excess emissions report. All records shall be maintained and readily available for a minimum of five years.

Shutdown duration

Shutdown is defined as the period of time from initiation of shutdown by the control room operator until a "FLAME OFF" signal is received from the DCS. The duration of a shutdown shall not exceed 20 minutes.

The owner or operator shall record the date and time of each shutdown event. A report consisting of the recorded information shall be submitted to the Department with the facility's required

excess emissions report. All records shall be maintained and readily available for a minimum of five years.

Definition of "Tuning event"

In addition to the proposed startup and shutdown limits required by Condition 24 of the Permit, the Facility also requests that "tuning event" be defined as a maintenance activity for each combustion turbine, during which the emission limits for steady-state operation, startup, and shutdown do not apply. Each GE 7FA.05 combustion turbine will require seasonal tuning of the machine twice a year, once prior to the summer and once prior to the winter. Each tuning period is designed to optimize the turbine for ambient conditions during the upcoming season, while minimizing the likelihood of excessive emissions, excessive combustor dynamics, or loss of flame (due to lean blow-out). The Facility requests that an allowance be made for tuning to be performed twice a year on each combustion turbine, with each tuning event lasting up to 4 hours.

The following definition of "tuning event" is proposed to be added as a compliance condition:

> Tuning event is defined as a period of low-load operation of a combustion turbine for the purpose of tuning the turbine prior to the summer or winter season, not to exceed four hours per event, during which the emission limits for steady-state operation, startup, and shutdown do not apply. Each combustion turbine is allowed up to two tuning events per calendar year.

Startup emission limits

> The owner or operator shall limit NO_X emissions from each combustion turbine generator to 80.0 pounds per startup event. Emissions shall be monitored and recorded on a continuous basis with a CEM system.
>
> The owner or operator shall limit CO emissions from each combustion turbine generator to 330.0 pounds per startup event. Emissions shall be monitored and recorded on a continuous basis with a CEM system.
>
> The owner or operator shall limit NH_3 emissions from each combustion turbine generator to 25.0 pounds per startup event. Emissions shall be monitored and recorded on a continuous basis with a CEM system.

Shutdown emission limits

> The owner or operator shall limit NO_X emissions from each combustion turbine generator to 5.0 pounds per shutdown event. Emissions shall be monitored and recorded on a continuous basis with a CEM system.
>
> The owner or operator shall limit CO emissions from each combustion turbine generator to 5.0 pounds per shutdown event. Emissions shall be monitored and recorded on a continuous basis with a CEM system.

The owner or operator shall limit NH_3 emissions from each combustion turbine generator to 3.0 pounds per shutdown event. Emissions shall be monitored and recorded on a continuous basis with a CEM system.

Steady-State Emission Limits for NOx, CO, and NH_3

NOx ppmvd emission limit: Item 1.6-2

In addition to the proposed NOx emission limits presented above for startup and shutdown conditions, the Facility requests that Item 1.6-2 of the existing Permit be amended to include a statement that the NOx ppmvd limit does not apply to any 1-hour average that contains at least one minute of startup or shutdown, and does not apply to any 1-hour average that includes part of a tuning event, such that the monitoring description reads:

> Facility must maintain a NOx emission limit of 2.0 ppmvd at 15 percent O2 (with and without duct burning) to satisfy LAER. This will be achieved through the application of DLN burners in combination with Selective Catalytic Reduction (SCR). This limit applies at all load conditions, except that it does not apply to any 1-hour average that includes at least one minute of a startup, shutdown, or tuning event. The facility will use CEMS to monitor NOx stack emissions.

CO ppmvd emission limit: Item 46.2

In addition to the proposed CO emission limits presented above for startup and shutdown conditions, the Facility requests that Item 46.2 of the existing Permit be amended to include a statement that the CO ppmvd limit does not apply to any 1-hour average that contains at least one minute of startup or shutdown, and does not apply to any 1-hour average that includes part of a tuning event, such that the monitoring description reads:

> Each combustion turbine and associated duct burner will not exceed a CO emission rate of 2.0 ppmvd at 15% oxygen, with and without duct firing. This emission limit applies at all operating loads, except that it does not apply to any 1-hour average that includes at least one minute of a startup, shutdown, or tuning event, and will be achieved through good combustion practices and an oxidation catalyst to satisfy BACT requirements. The facility will install, operate and maintain a CEMS in order to monitor CO stack emissions.

Ammonia slip ppmvd emission limit: Item 23.2

In addition to the proposed NH_3 emission limits presented above for startup and shutdown conditions, the Facility requests that Item 23.2 of the existing Permit be amended to include a statement that the CO ppmvd limit does not apply to any 1-hour average that contains at least one minute of startup or shutdown, and does not apply to any 1-hour average that includes part of a tuning event, such that the monitoring description reads:

> The facility shall install, calibrate, maintain and operate continuous emissions monitors for ammonia. The 5.0 ppmvd corrected to 15% Oxygen limit applies during all turbine loads, all fuels being fired, and all duct burner operations, except that it does not apply to any 1-hour average that includes at least one minute of a startup, shutdown, or tuning event.

During startup, ammonia is being injected in the selective catalytic reduction (SCR) system to control NO_X as the temperature of the catalyst rises to the design temperature range. Ammonia slip is unstable and unpredictable during this time period and partial hour data validation could result in slip concentrations being greater than 5 ppmvd @ 15% O_2. If a unit starts up in the last few minutes at the top of the hour, those few minutes of initial slip concentration data are enough to validate the hour. Specifically, 40 CFR 60.13(h)(2)(iii)(B) states that only one valid data point is needed to calculate an hourly average if the unit operates only operates in one quadrant of the hour, thus necessitating the clarification. The clarification is also consistent with the exception provided for steady-state NO_X and CO emission limits listed in Items 1-6.2 and Item 46.2 of the Permit. This exclusion appears to have been inadvertently left out of the originally-issued permit, and an ammonia limit during startups and shutdowns is unusual in our experience with other power plants.

Read the standard requirements.

Permit Requirements

(1) The designated representative of each affected source and each affected unit at the source shall:
- (i) Submit a complete Acid Rain permit application (including a compliance plan) under 40 CFR part 72 in accordance with the deadlines specified in 40 CFR 72.30; and
- (ii) Submit in a timely manner any supplemental information that the permitting authority determines is necessary in order to review an Acid Rain permit application and issue or deny an Acid Rain permit;

(2) The owners and operators of each affected source and each affected unit at the source shall:
- (i) Operate the unit in compliance with a complete Acid Rain permit application or a superseding Acid Rain permit issued by the permitting authority; and
- (ii) Have an Acid Rain Permit.

Monitoring Requirements

(1) The owners and operators and, to the extent applicable, designated representative of each affected source and each affected unit at the source shall comply with the monitoring requirements as provided in 40 CFR part 75.

(2) The emissions measurements recorded and reported in accordance with 40 CFR part 75 shall be used to determine compliance by the source or unit, as appropriate, with the Acid Rain emissions limitations and emissions reduction requirements for sulfur dioxide and nitrogen oxides under the Acid Rain Program.

(3) The requirements of 40 CFR part 75 shall not affect the responsibility of the owners and operators to monitor emissions of other pollutants or other emissions characteristics at the unit under other applicable requirements of the Act and other provisions of the operating permit for the source.

Sulfur Dioxide Requirements

(1) The owners and operators of each source and each affected unit at the source shall:
- (i) Hold allowances, as of the allowance transfer deadline, in the source's compliance account (after deductions under 40 CFR 73.34(c)), not less than the total annual emissions of sulfur dioxide for the previous calendar year from the affected units at the source; and
- (ii) Comply with the applicable Acid Rain emissions limitations for sulfur dioxide.

(2) Each ton of sulfur dioxide emitted in excess of the Acid Rain emissions limitations for sulfur dioxide shall constitute a separate violation of the Act.

(3) An affected unit shall be subject to the requirements under paragraph (1) of the sulfur dioxide requirements as follows:
- (i) Starting January 1, 2000, an affected unit under 40 CFR 72.6(a)(2); or
- (ii) Starting on the later of January 1, 2000 or the deadline for monitor certification under 40 CFR part 75, an affected unit under 40 CFR 72.6(a)(3).

(4) Allowances shall be held in, deducted from, or transferred among Allowance Tracking System accounts in accordance with the Acid Rain Program.

(5) An allowance shall not be deducted in order to comply with the requirements under paragraph (1) of the sulfur dioxide requirements prior to the calendar year for which the allowance was allocated.

(6) An allowance allocated by the Administrator under the Acid Rain Program is a limited authorization to emit sulfur dioxide in accordance with the Acid Rain Program. No provision of the Acid Rain Program, the Acid Rain permit application, the Acid Rain permit, or an exemption under 40 CFR 72.7 or 72.8 and no provision of law shall be construed to limit the authority of the United States to terminate or limit such authorization.

(7) An allowance allocated by the Administrator under the Acid Rain Program does not constitute a property right.

Nitrogen Oxides Requirements

The owners and operators of the source and each affected unit at the source shall comply with the applicable Acid Rain emissions limitation for nitrogen oxides.

Cricket Valley Energy Center
Facility (Source) Name (from STEP 1)

STEP 3, Cont'd.

Excess Emissions Requirements

(1) The designated representative of an affected source that has excess emissions in any calendar year shall submit a proposed offset plan, as required under 40 CFR part 77.
(2) The owners and operators of an affected source that has excess emissions in any calendar year shall:
   (i) Pay without demand the penalty required, and pay upon demand the interest on that penalty, as required by 40 CFR part 77; and
   (ii) Comply with the terms of an approved offset plan, as required by 40 CFR part 77.

Recordkeeping and Reporting Requirements

(1) Unless otherwise provided, the owners and operators of the source and each affected unit at the source shall keep on site at the source each of the following documents for a period of 5 years from the date the document is created. This period may be extended for cause, at any time prior to the end of 5 years, in writing by the Administrator or permitting authority:
   (i) The certificate of representation for the designated representative for the source and each affected unit at the source and all documents that demonstrate the truth of the statements in the certificate of representation, in accordance with 40 CFR 72.24; provided that the certificate and documents shall be retained on site at the source beyond such 5-year period until such documents are superseded because of the submission of a new certificate of representation changing the designated representative;
   (ii) All emissions monitoring information, in accordance with 40 CFR part 75, provided that to the extent that 40 CFR part 75 provides for a 3-year period for recordkeeping, the 3-year period shall apply.
   (iii) Copies of all reports, compliance certifications, and other submissions and all records made or required under the Acid Rain Program; and,
   (iv) Copies of all documents used to complete an Acid Rain permit application and any other submission under the Acid Rain Program or to demonstrate compliance with the requirements of the Acid Rain Program.
(2) The designated representative of an affected source and each affected unit at the source shall submit the reports and compliance certifications required under the Acid Rain Program, including those under 40 CFR part 72 subpart I and 40 CFR part 75.

Liability

(1) Any person who knowingly violates any requirement or prohibition of the Acid Rain Program, a complete Acid Rain permit application, an Acid Rain permit, or an exemption under 40 CFR 72.7 or 72.8, including any requirement for the payment of any penalty owed to the United States, shall be subject to enforcement pursuant to section 113(c) of the Act.
(2) Any person who knowingly makes a false, material statement in any record, submission, or report under the Acid Rain Program shall be subject to criminal enforcement pursuant to section 113(c) of the Act and 18 U.S.C. 1001.
(3) No permit revision shall excuse any violation of the requirements of the Acid Rain Program that occurs prior to the date that the revision takes effect.
(4) Each affected source and each affected unit shall meet the requirements of the Acid Rain Program.
(5) Any provision of the Acid Rain Program that applies to an affected source (including a provision applicable to the designated representative of an affected source) shall also apply to the owners and operators of such source and of the affected units at the source.
(6) Any provision of the Acid Rain Program that applies to an affected unit (including a provision applicable to the designated representative of an affected unit) shall also apply to the owners and operators of such unit.
(7) Each violation of a provision of 40 CFR parts 72, 73, 74, 75, 76, 77, and 78 by an affected source or affected unit, or by an owner or operator or designated representative of such source or unit, shall be a separate violation of the Act.

STEP 3, Cont'd.

Effect on Other Authorities

No provision of the Acid Rain Program, an Acid Rain permit application, an Acid Rain permit, or an exemption under 40 CFR 72.7 or 72.8 shall be construed as:

(1) Except as expressly provided in title IV of the Act, exempting or excluding the owners and operators and, to the extent applicable, the designated representative of an affected source or affected unit from compliance with any other provision of the Act, including the provisions of title I of the Act relating to applicable National Ambient Air Quality Standards or State Implementation Plans;

(2) Limiting the number of allowances a source can hold; provided, that the number of allowances held by the source shall not affect the source's obligation to comply with any other provisions of the Act;

(3) Requiring a change of any kind in any State law regulating electric utility rates and charges, affecting any State law regarding such State regulation, or limiting such State regulation, including any prudence review requirements under such State law;

(4) Modifying the Federal Power Act or affecting the authority of the Federal Energy Regulatory Commission under the Federal Power Act; or,

(5) Interfering with or impairing any program for competitive bidding for power supply in a State in which such program is established.

Emissions Compliance Test
General Electric, 7F.05, Unit #U-00001

February 17-19 and March 6, 2020

1.0 INTRODUCTION

Air Hygiene International, Inc. (Air Hygiene) has completed the Emissions Compliance Test for nitrogen oxides (NOx), carbon monoxide (CO), total hydrocarbons/volatile organic compounds (THC/VOC), sulfur dioxide (SO_2) [by fuel analysis], ammonia (NH_3), particulate matter (PM_{10}), sulfuric acid mist (SAM), opacity / visual emissions (VE), flow, moisture (H_2O), carbon dioxide (CO_2), and oxygen (O_2) from the exhaust of the General Electric, 7F.05, Unit #U-00001 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. This report details the background, results, process description, and the sampling/analysis methodology of the stack sampling survey conducted on February 17-19 and March 6, 2020.

1.1 TEST PURPOSE AND OBJECTIVES

The purpose of the test was to conduct an initial compliance emission test to document levels of selected pollutants at two test loads, base loaded with duct burners on and base loaded with duct burners off (Base+DB and Base). An additional load included opacity only with the unit operating at Base+DB and the Auxiliary Boiler operating at maximum load. Both of these units share a common stack and this run condition has the potential for maximum VE production. The information will be used to confirm compliance with the operating permit issued by the New York State Department of Environmental Conservation (NYSDEC). The specific objective was to determine the emission concentrations and rates of NOx, CO, THC/VOC, SO_2 [fuel analysis], NH_3, PM_{10}, SAM, VE, flow, H_2O, CO_2, and O_2 from the exhaust of Cricket Valley Energy Center LLC's General Electric, 7F.05, Unit #U-00001 at Base+DB and Base.

1.2 SUMMARY OF TEST PROGRAM

Notes: [1]Base+DB Load and Aux Boiler Heat Input estimated using 02/19/20 fuel gas analysis. [2]Air permit specifically indicates design capacity heat input of 2395.7 MMBtu/hr [ISO Conditions, 1 atm (29.923 in Hg), temperature 15 C or 59 F, and RH 60%] for the gas turbine. [3]Air permit specifically indicates design capacity heat input of 247 mmBtu/hr [ISO Conditions, 1 atm (29.923 in Hg), temperature 15 C or 59 F, and RH 60%] for the duct burner.

The results of all measured pollutant emissions were below the required limits. All testing was conducted according to the approved testing protocol. All testing was performed without any real or apparent errors with the following exceptions:

The PM_{10} filter weights were reported by the laboratory at the reportable detection limit (RDL), but included notes indicating negative filter weights. Supplemental laboratory data was provided (Appendix D) and additional data analysis indicated filter losses were accounted for in either the sample train section cleanup just prior to the filter or the sample train cleanup in the section just after the filter. As a result, the PM results are considered valid with accounting for all filter weight losses in other fractions of the sample train results.

The initial SAM analysis was conducted by titration, per the requirements of CTM-013 with all results reported below the reportable detection limits (RDLs). However, when reporting emission rates using the titration based RDL values, the SAM results exceeded permitted limits. To remedy, the SAM analysis was conducted by ion

chromatography (IC). The supplemental IC analysis (Appendix D) yielded lower RDLs and also all results that were below the permitted limits. Emission rates were calculated based on the supplemental IC data.

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a "test mode" (Mode 0) setting, and not the expected "natural gas mode" setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas). The combined U-00001 Base with DB fired and auxiliary boiler in operation load opacity test was performed after the fuel gas flowmeter mode operation was corrected on 2/21/2020.

3.0 SOURCE OPERATION

3.1 PROCESS DESCRIPTION

Cricket Valley Energy Center LLC owns and operates the Cricket Valley Energy Center located at 2241 ST RTE 22 in Dover Plains, New York. Located on the Cricket Valley Energy Center are three General Electric 7F.05 Combustion Turbine Generators (CTGs), designated as Emission Units U-00001, U-00002, and U-00003. The CTGs and associated heat recovery steam generators (HRSGs) which are equipped with dry low NOx burners in combination with selective catalytic reduction systems (SCRs). The CTG-HRSGs are also equipped with oxidation catalysts which reduce CO and VOC emissions.

3.2 SAMPLING LOCATION

The sample ports were located approximately vertical, circular and measures 19 feet (ft) (228 inches) in diameter at the test ports which are approximately 265.8 ft above grade level with an exit elevation of approximately 282.5 ft above grade level. The test ports are located approximately 70.8 ft (850 inches) downstream and approximately 16.7 ft (200.4 inches) upstream from the nearest disturbances. Air Hygiene has field verified the measurable dimensions. Non-field verified dimensions are provided by Cricket Valley Energy Center LLC. All exhaust samples for gaseous emissions were continuously drawn from the exhaust system at the sample ports from a single point determined after conducting a stratification test. During the stratification test three points were traversed from each of the four ports. The probe was allowed to remain at a point for two times the system response time. For PM_{10} testing, an initial velocity traverse was performed across the stack from 12 total points at each test load. All PM_{10} sampling occurred from the same 12 points. All SAM testing occurred from a simple sample point. All opacity observations were made by viewing the point where the exhaust system exited to the atmosphere at the top of the exhaust stack.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

4.1 TEST METHODS

The emission test on the General Electric, 7F.05, Unit #U-00001 at the Cricket Valley Energy Center was performed following United States Environmental Protection Agency (EPA) methods described by the Code of Federal Regulations (CFR). Table 4.1 outlines the specific methods performed on February 17-19 and March 6, 2020.

4.2 INSTRUMENT CONFIGURATION AND OPERATIONS FOR GAS ANALYSIS

The sampling and analysis procedures used during these tests conform with the methods outlined in the Code of Federal Regulations (CFR), Title 40, Part 60, Appendix A, Methods 1, 2, 3A, 4, 7E, 9, 10, 18, 19, 25A; 40 CFR 51, Appendix M, Methods 201A and 202; 40 CFR 63, Appendix A, Method 320; Conditional Test Method (CTM)-013 [Method 8A]; ASTM 5504; and GPA 2261.

Figure 4.1 depicts the sample system used for the real-time gas analyzer tests. The gas sample was continuously pulled through the probe and transported, via heat-traced Teflon® tubing, to a heated head pump and into the FTIR then to a stainless-steel minimum-contact condenser designed to dry the sample. Transportation of the sample, through Teflon® tubing, continued into the sample manifold within the mobile laboratory via a stainless steel/Teflon® diaphragm pump. From the manifold, the sample was partitioned to the real-time analyzers through rotameters that controlled the flow rate of the sample. Exhaust samples were routed to the wet based analyzer prior to gas conditioning.

Figure 4.1 shows that the sample system was also equipped with a separate path through which a calibration gas could be delivered to the probe and back through the entire sampling system. This allowed for convenient performance of system bias checks as required by the testing methods.

All instruments were housed in a climate controlled, trailer-mounted mobile laboratory. Gaseous calibration standards were provided in aluminum cylinders with the concentrations certified by the vendor. EPA Protocol No. 1 was used to determine the cylinder concentrations where applicable (i.e. NOx calibration gases).

Table 4.2 provides a description of the analyzers used for the instrument portion of the tests. All data from the continuous monitoring instruments were recorded on a Logic Beach Portable Data Logging System which retrieves calibrated electronic data from each instrument every one second and reports an average of the collected data every 30 seconds. For target compounds measured with the Fourier transform infrared (FTIR) spectrometer, interferograms consisting of 27 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations. Spectral data was analyzed by the MKS MG2000 software.

Figure 4.2 represents the sample system used for the PM_{10} tests. A heated stainless-steel probe with a glass liner and stainless-steel nozzle was inserted into the sample ports of the stack to extract gas measurements from the emission stream through a filter and glass impinger train. Flow rates are monitored with oil filled manometers and total sample volumes are measured with a dry gas meter. Glassware that is used to collect and analyze Method 202 condensable particulate samples is cleaned prior to the test with soap and water, and rinsed using tap water, deionized water, acetone, and finally, hexane. After cleaning, Air Hygiene incorporates a glassware bake at 300^{o}C for six hours rather than the alternative of collecting a field train proof blank.

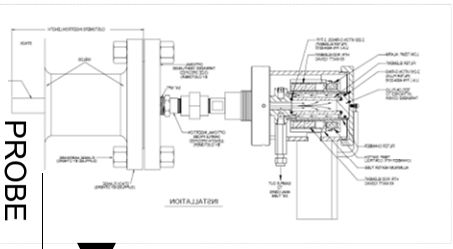
Figure 4.3 represents the sample system used for the SAM tests. A heated stainless-steel probe with a glass liner was inserted into a sample port of the stack to extract gas measurements from the emission stream through a filter and glass impinger train. Flow rates are monitored with oil filled manometers and total sample volumes are measured with a dry gas meter.

The stack gas analysis for O_2 and CO_2 concentrations was performed in accordance with procedures set forth in EPA Method 3A. The O_2 analyzer uses a paramagnetic cell detector and the CO_2 analyzer uses a continuous nondispersive infrared analyzer.

EPA Method 7E was used to determine concentrations of NOx. A chemiluminescent analyzer was used to determine the nitrogen oxides concentration in the gas stream. A NO_2 in nitrogen certified gas cylinder was used to verify at least a 90 percent NO_2 conversion on the day of the test.

CO emission concentrations were quantified in accordance with procedures set forth in EPA Method 10. A continuous nondispersive infrared (NDIR) analyzer was used for this purpose.

THC emission concentrations were quantified in accordance with procedures set forth in EPA Method 25A. A continuous flame ionization (FID) analyzer was used for this purpose. THC emissions concentrations were below VOC limits and all assumed as VOCs. EPA Method 18 for Tedlar bag sampling and analysis of methane and ethane content was not analyzed or subtracted from the THC concentrations to determine VOC concentrations.



An MKS Instruments - MultiGas™ Fourier Transform Infrared (FTIR) spectrometer, or equivalent, was used for NH_3 analysis per EPA Method 320. The FTIR spectrometer spectral resolution was 0.5 cm^{-1}. The system employed a silicon carbide infrared source at 1200ºC, a helium neon reference laser, beam splitters, potassium bromide (KBr) cell window, front-surface optical transfer mirrors, and multi-pass absorption cells. MCT detectors were used and cooled with liquid nitrogen in order to maintain a constant temperature of 77 Kelvin. The approximately 5.11-meter multi-pass path cells incorporated aspheric, aberration-correcting mirrors to increase the optical throughput and the detection sensitivity. Transducers and thermocouples were connected directly to

the insulated sample cells that provide the pressure and temperatures of the sample streams. During testing, the temperature of the absorption cells was set at 191ºC. Elevated temperature prevented gas condensation within the cell and minimized compound adhesion to the cell walls and mirrors. The volume of the absorption cell was 0.5 liters, so at a sample gas flow rate of 10.0 liters per minute, the sample gas in the cell is refreshed at least times each minute. Interferograms consisting of 27 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations.

Calculations, Formulas, and Constants

The following information supports the spreadsheets for this testing project.

Given Data:

Ideal Gas Conversion Factor = 385.23 SCF/lb-mol at 68 deg F & 14.696 psia

Fuel Heating Value is based upon Air Hygiene's fuel gas calculation sheet. All calculations are based upon a correction to 68 deg F & 14.696 psia

High Heating Values (HHV) are used for the Fuel Heating Value, F-Factor, and Fuel Flow Data per EPA requirements.

Formulas:

1. Corrected Raw Average (C_{Gas}), 40CFR60, App. A, RM 7E, Eq. 7E-5 (08/15/06)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$

2. Correction to % O_2, 40CFR60, App. A, RM 20, Eq. 20-5 (11/26/02)

$$C_{adj} = C_{Gas(T\,\mathrm{arg}\,et)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$

3. Correction to % O_2 and ISO Conditions

$$C_{ISO} = C_{Adj} \times \sqrt{\frac{P_r}{P_o}} \times e^{(19 \times (H_O - 0.00633))} \times \left(\frac{288}{T_a}\right)^{1.53}$$

4. Method 19 stack exhaust flow (scfh) [ref. EPA EMC FAQ Method 19]

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000}\right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}}\right)$$

5. Emission Rate in lb/hr

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

6. Emission Rate in tons per year

$$E_{ton/yr} = \frac{E_{lb/hr} \times hr_{year}}{2000}$$

7. Emission Concentration in lb/MMBtu (O_2 based)

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$

8. Emission Concentration in g/hp*hr

$$E_{g/hp\cdot hr} = \frac{E_{lb/hr} \times 453.6}{mw \times 1341.022} \; or \; \frac{E_{lb/hr} \times 453.6}{hp}$$

RM 7E, (08-15-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

ACE = Analyzer calibration error, percent of calibration span.
B_{WS} = Moisture content of sample gas as measured by Method 4 or other approved method, percent/100.
C_{Avg} = Average unadjusted gas concentration indicated by data recorder for the test run.
C_D = Pollutant concentration adjusted to dry conditions.
C_{Dir} = Measured concentration of a calibration gas (low, mid, or high) when introduced in direct calibration mode.
C_{Gas} = Average effluent gas concentration adjusted for bias.
C_M = Average of initial and final system calibration bias (or 2-point system calibration error) check responses for the upscale calibration gas.
C_{MA} = Actual concentration of the upscale calibration gas, ppmv.
C_O = Average of the initial and final system calibration bias (or 2-point system calibration error) check responses from the low-level (or zero) calibration gas.
C_S = Measured concentration of a calibration gas (low, mid, or high) when introduced in system calibration mode.
C_{SS} = Concentration of NOx measured in the spiked sample.
C_{Spike} = Concentration of NOx in the undiluted spike gas.
C_{Calc} = Calculated concentration of NOx in the spike gas diluted in the sample.
C_V = Manufacturer certified concentration of a calibration gas (low, mid, or high).
C_W = Pollutant concentration measured under moist sample conditions, wet basis.
CS = Calibration span.
D = Drift assessment, percent of calibration span.
E_p = The predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response.
Eff_{NO2} = NO_2 to NO converter efficiency, percent.
H = High calibration gas, designator.
L = Low calibration gas, designator.
M = Mid calibration gas, designator.
NOFinal = The average NO concentration observed with the analyzer in the NO mode during the converter efficiency test in Section 16.2.2.
NOxCorr = The NOx concentration corrected for the converter efficiency.
NOxFinal = The final NOx concentration observed during the converter efficiency test in Section 16.2.2.
NOxPeak = The highest NOx concentration observed during the converter efficiency test in Section 16.2.2.
Q_{Spike} = Flow rate of spike gas introduced in system calibration mode, L/min.
Q_{Total} = Total sample flow rate during the spike test, L/min.
R = Spike recovery, percent.
SB = System bias, percent of calibration span.
SB_i = Pre-run system bias, percent of calibration span.
SB_f = Post-run system bias, percent of calibration span.
SB / D_{Alt} = Alternative absolute difference criteria to pass bias and/or drift checks.
SCE = System calibration error, percent of calibration span.
SCE_i = Pre-run system calibration error, percent of calibration span.
SCE_{final} = Post-run system calibration error, percent of calibration span.
Z = Zero calibration gas, designator.

hp = horsepower
Q_{sys} = system flow (lpm)
Q_m = matrix spike flow (lpm)

RM 19, (07-29-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

AdjFactor = Percent oxygen or carbon dioxide adjustment applied to a target pollutant
B_{wa} = Moisture fraction of ambient air, percent.
Btu = British thermal unit
$\%_C$ = Concentration of carbon from an ultimate analysis of fuel, weight percent.
$\%_{CO2d}$,$\%_{CO2w}$ = Concentration of carbon dioxide on a dry and wet basis, respectively, percent.
CIP / CDP = Combustor inlet pressure / compressor discharge pressure (mm Hg); note, some manufactures reference as PCD.
E = Pollutant emission rate, ng/J (lb/million Btu).
E_a = Average pollutant rate for the specified performance test period, ng/J (lb/million Btu).
E_{ao}, E_{ai} = Average pollutant rate of the control device, outlet and inlet, respectively, for the performance test period, ng/J (lb/million Btu).
E_{bi} = Pollutant rate from the steam generating unit, ng/J (lb/million Btu).
E_{bo} = Pollutant emission rate from the steam generating unit, ng/J (lb/million Btu).
E_{ci} = Pollutant rate in combined effluent, ng/J (lb/million Btu).
E_{co} = Pollutant emission rate in combined effluent, ng/J (lb/million Btu).
E_d = Average pollutant rate for each sampling period (e.g.,24-hr Method 6B sample or 24-hr fuel sample) or for each fuel lot (e.g., amount of fuel bunkered), ng/J (lb/million Btu).
E_{di} = Average inlet SO_2 rate for each sampling period d, ng/J (lb/million Btu).
E_g = Pollutant rate from gas turbine, ng/J (lb/million Btu).
E_{ga} = Daily geometric average pollutant rate, ng/J (lbs/million Btu) or ppm corrected to 7 percent O_2.
E_{jo},E_{ji} = Matched pair hourly arithmetic average pollutant rate, outlet and inlet, respectively, ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
E_h = Hourly average pollutant, ng/J (lb/million Btu).
E_{hj} = Hourly arithmetic average pollutant rate for hour "j," ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
EXP = Natural logarithmic base (2.718) raised to the value enclosed by brackets.
Fc = Ratio of the volume of carbon dioxide produced to the gross calorific value of the fuel from Method 19
F_d, F_w, F_c = Volumes of combustion components per unit of heat content, scm/J (scf/million Btu).
ft^3 = cubic feet
G = ideal gas conversion factor
(385.23 SCF/lb-mol at 68 deg F & 14.696 psia)
GCM = gross Btu per SCF (constant, compound based)
GCV = Gross calorific value of the fuel consistent with the ultimate analysis, kJ/kg (Btu/lb).
GCV_p, GCV_r = Gross calorific value for the product and raw fuel lots, respectively, dry basis, kJ/kg (Btu/lb).
$\%_H$ = Concentration of hydrogen from an ultimate analysis of fuel, weight percent.
H_b = Heat input rate to the steam generating unit from fuels fired in the steam generating unit, J/hr (million Btu/hr).
H_g = Heat input rate to gas turbine from all fuels fired in the gas turbine, J/hr (million Btu/hr).
$\%_{H2O}$ = Concentration of water from an ultimate analysis of fuel, weight percent.
H_r = Total numbers of hours in the performance test period (e.g., 720 hours for 30-day performance test period).
K = volume of combustion component per pound of component (constant)
K = Conversion factor, 10^{-5} (kJ/J)/(%) [10^6 Btu/million Btu].

EXAMPLE CALCULATIONS (FFACTOR)

RM 19, (02-27-14),
2.0 Summary of Method,
2.1 Emission Rates. Oxygen (O_2) or carbon dioxide (CO_2) concentrations and appropriate F factors (ratios of combustion gas volumes to heat inputs) are used to calculate pollutant emission rates from pollutant concentrations.

RM 19, (02-27-14),
12.2 Emission Rates of PM, SO_2, and NOx. Select from the following sections the applicable procedure to compute the PM, SO_2, or NOx emission rate (E) in lb/MMBtu. The pollutant concentration must be in lb/scf and the F factor must be in scf/MMBtu. If the pollutant concentration (C) is not in the appropriate units, use Table 19–1 in Section 17.0 to make the proper conversion. An F factor is the ratio of the gas volume of the products of combustion to the heat content of the fuel. The dry F factor (F_d) includes all components of combustion less water, the wet F factor (F_w) includes all components of combustion, and the carbon F factor (F_c) includes only carbon dioxide.

EXAMPLE CALCULATIONS (INFORMATION)

Specific Humidity (RH_{sp})

Note: RHsp (gr/lb) calculated using temperature, relative humidity, and barometric pressure with psychrometric chart, psychrometric calculator, or built in psychrometric algorithm.

$$RH_{sp}(lb/lb) = \left[\left(\frac{gr}{lb}\right) \times \frac{lb}{7000\,gr}\right]$$

$$RH_{sp} = \frac{16.47\ gr}{lb} \times \frac{1\ lb}{7000\ gr} = 0.002353\ \frac{lb\ H_2O}{lb\ Air}$$

Fuel Flow Conversion (Q_f)

Note: Qf(lb/min) is a value obtained from the source operator.

$$Q_f = \left[Q_f \times G \times \left(\frac{1}{MW_{Fuel}}\right)\right]$$

$$Q_f = \frac{1{,}672.52\ lb}{min} \times \frac{60\ min}{hr} \times \frac{385.23\ ft^3}{lb\text{-}mol} \times \frac{lb\text{-}mol}{17.10\ lb} = 2{,}260{,}589\ SCFH$$

EXAMPLE CALCULATIONS (CALIBRATION)

Analyzer Calibration Error

RM 7E, (02-27-14), 12.2 Analyzer Calibration Error. For non-dilution systems, use Equation 7E-1 to calculate the analyzer calibration error for the low-, mid-, and high-level calibration gases. (calc for NOx analyzer mid gas, if applicable)

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100 \qquad \text{Eq. 7E-1}$$

$$ACE = \frac{8.73\ ppm - 8.90\ ppm}{17.80\ ppm} \times 100 = -0.96\ \%$$

Calibration Error and Estimated Point, RM 25A, THC/VOC Analyzer

RM 25A, (02-27-14), 8.4 Calibration Error Test. Immediately prior to the test series (within 2 hours of the start of the test), introduce zero gas and high-level calibration gas at the calibration valve assembly. Adjust the analyzer output to the appropriate levels, if necessary. Calculate the predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response. Then introduce low-level and mid-level calibration gases successively to the measurement system. ... These differences must be less than 5 percent of the respective calibration gas value. (calc for THC/VOC analyzer mid gas, if applicable)

$$E_P = \frac{C_{Dir(H)} - C_{Dir(Z)}}{C_{V(H)} - C_{V(Z)}} \times C_{Dir(M)} + C_{Dir(Z)}$$

Eq. of a line
y=mx+b

$$E_p = \frac{8.89\ ppm - 0.00\ ppm}{8.77\ ppm - 0.00\ ppm} \times 4.90\ ppm + 0.00 = 4.97\ ppm$$

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100 \qquad \text{Eq. 7E-1}$$

$$ACE_{VOC(} = \frac{5.12\ ppm - 4.97\ ppm}{4.90\ ppm} \times 100 = 3.12\ \%$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (BIAS, DRIFT, AND CORRECTED RAW AVERAGE)

System Bias

RM 7E, (02-27-14), 12.3 System Bias. For non-dilution systems, use Equation 7E-2 to calculate the system bias separately for the low-level and upscale calibration gases. (calc for NOx analyzer upscale gas, Run 1 initial bias, if applicable)

$$SB = \left(\frac{C_S - C_{Dir}}{CS}\right) \times 100$$ Eq. 7E-2

SB = $\frac{8.91 \text{ ppm} - 8.73 \text{ ppm}}{17.80 \text{ ppm}}$ x 100 = 1.01 %

Drift Assessment

RM 7E, (02-27-14), 12.5 Drift Assessment. Use Equation 7E-4 to separately calculate the low-level and upscale drift over each test run. (calc for NOx analyzer upscale drift, Run 1, if applicable)

$$D = \left|SB_{final} - SB_i\right|$$ Eq. 7E-4

D = | 1.85 % - 1.01 % | = 0.84 %

Alternative Drift and Bias

RM 7E, (02-27-14), 13.2 / 13.3 System Bias and Drift. Alternatively, the results are acceptable if |Cs – Cdir| is ≤ 0.5 ppmv or if |Cs – Cv| is ≤ 0.5 ppmv (as applicable). (calc for NOx analyzer initial upscale, Run 1, if applicable)

$$SB / D_{Alt} = \left|C_S - C_{Dir}\right|$$ Eq. Section 13.2 and 13.3

SB / D_{Alt} = | 8.91 ppm - 8.73 ppm | = 0.18 ppm

Bias Adjusted Average

RM 7E, (02-27-14), 12.6 Effluent Gas Concentration. For each test run, calculate Cavg, the arithmetic average of all valid NOx concentration values (e.g., 1-minute averages). Then adjust the value of Cavg for bias, using Equation 7E-5b. (calc for NOx analyzer, Run 1, if applicable)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$ Eq. 7E-5b

C_{Gas} = $\left(2.48 \text{ ppm} - 0.02 \text{ ppm}\right)$ $\left(\frac{8.90 \text{ ppm}}{8.99 \text{ ppm} - 0.02 \text{ ppm}}\right)$ = 2.45 ppm

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RUNS)

Moisture Correction

RM 7E, (02-27-14), 12.10 Moisture Correction. Use Equation 7E-10 if your measurements need to be corrected to a dry basis. (calc for NOx analyzer, Run 1, if applicable) Note: Calculations may not match as Run 1 results are typically also bias adjusted

$$C_D = \frac{C_W}{1 - B_{WS}}$$ Eq. 7E-10

C_D = $\frac{2.31 \text{ ppmvw}}{1 - 0.06}$ = 2.45 ppmvd or inversely, $C_W = C_D \times \left(1 - B_{WS}\right)$

C_W = 2.45 ppmvd x $\left(1 - 0.06\right)$ = 2.31 ppmvw

Diluent-Corrected Pollutant Concentration, O_2 Based

RM 20, (11-26-02), 7.3.1 Correction of Pollutant Concentration Using O_2 Concentration. Calculate the O_2 corrected pollutant concentration, as follows: (calc for NOx gas, Run 1, if applicable) [now contained in applicable Subpart]

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$ Eq. 20-4

C_{adj} = 2.45 ppm x $\left(\frac{20.9\% - 15.00\ \%}{20.9\% - 12.88\ \%}\right)$ = 1.80 ppm@15%O_2

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

- %CO = carbon monoxide concentration (%)
- $\%CO_2$ = carbon dioxide concentration (%)
- $\%N_2$ = nitrogen concentration (%)
- $\%O_2$ = oxygen concentration (%)
- $\%O_{2,wet}$ = Oxygen content of gas stream, % by volume of wet gas. (Note: The oxygen percentage used in Method 201A, Equation 3 is on a wet gas basis. That means that since oxygen is typically measured on a dry gas basis, the measured percent O2 must be multiplied by the quantity (1 - B_{ws}) to convert to the actual volume fraction. Therefore, $\%O_{2,wet} = (1 - B_{ws}) * \%O_{2,\,dry}$)

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{mw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12\text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

EXAMPLE CALCULATIONS (Isokinetic Sampling) [Values from Run 1 test]

Cumulative Percent Isokinetic (%) (weighted average of all points)

$$I(\%) = \sum_{1-n} \frac{\left[I(\%) \times V_{m(std)}\right]_{1-n}}{V_{m(std)_{1-n}}}$$

Using Method 5, Eq 5-8 to determine intermediate isokinetics at each point, weighted averaging of the cumulative isokinetics is necessary since all points are not equal, and determined by using the dry standard meter volume collected at each point to weight the cumulative average. Intermediate isokinetics and dry standard meter volumes are found at each point. At each point the cumulative sum is found of each value and the quotient of the two used to determine the cumulative isokinetics for each residual point (n).

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{nw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D\,(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s\,(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12\text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D\,(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{nw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D\,(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s\,(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12\text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D\,(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 3a) [Values from Run 1 test]

Carbon Monoxide Concentration (%)

$$\%CO = \frac{ppmCO}{10{,}000}$$

$$\%CO\ (\%) = \frac{0.00 \quad ppm}{10{,}000\ ppm/\%} = 0.0000\ \%$$

Nitrogen Concentration (%)

$$\%N_2 = 100 - \%CO_2 - \%O_2 - \%CO$$

$\%N_2$ (%) = 100 - 5.30 % - 11.68 % - 0.00 / 10,000 % = 83.02 %

Stack Dry Molecular Weight (lb/lb-mole)

$$M_d\,(lb/lb-mol) = \sum\left(\frac{MW_{comp}}{100} \times \%component\right)$$

$$M_d\ (lb/lb\text{-}mol) = \left(\frac{44\ lb/lb\text{-}mol}{100} \times 5.30\ \%\right) +$$

$$\left(\frac{32\ lb/lb\text{-}mol}{100} \times 11.68\ \%\right) + \left(\frac{28\ lb/lb\text{-}mol}{100} \times \left[\frac{0.00}{10{,}000} + 83.02\ \right]\right) = \frac{29.32\ lb}{lb\text{-}mol}$$

Stack Wet Molecular Weight (lb/lb-mole)

$$M_S\,(lb/lb-mol) = \left[M_d \times \left(1 - \frac{B_{WS}}{100}\right)\right] + \left[MW_{H_2O} \times \frac{B_{WS}}{100}\right]$$

$$M_S\ (lb/lb\text{-}mol) = \left\{\frac{29.32\ lb}{lb\text{-}mol} \times \left(1 - \frac{6.94\ \%}{100}\right)\right\} + \left\{\frac{18\ lb}{lb\text{-}mol} \times \frac{6.94\ \%}{100}\right\} = \frac{28.53\ lb}{lb\text{-}mol}$$

Average Calculated Fuel Factor (F_o)

$$F_{o(avg)} = \frac{\left[20.9 - (\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}{(\%CO_2)_{avg} + (\%CO)_{avg}}$$

$$F_{o(avg)} = \frac{20.9\% - 11.68\ \% - (0.5 \times 0.000\ \%)}{5.30\ \% + 0.000\ \%} = 1.740$$

Average Excess Air (%)

$$\%EA_{avg}\,(\%) = \frac{100 \times \left[(\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}{(0.264 \times (N_2)_{avg}) - \left[(\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}$$

$$(\%EA)_{AVG} = \frac{100 \times \{\ 11.68\ \% - (0.5 \times 0.000\ \%)\ \}}{(\ 0.264 \times 83.02\ \%) - \{\ 11.68\ \% - (0.5 \times 0.000\ \%)\}} = 114.09\ \%$$

EXAMPLE CALCULATIONS (Isokinetic Sampling) [Values from Run 1 test]

Cumulative Percent Isokinetic (%) (weighted average of all points)

$$I(\%) = \sum_{1-n} \frac{\left[I(\%) \times V_{m(std)}\right]_{1-n}}{V_{m(std)_{1-n}}}$$

Using Method 5, Eq 5-8 to determine intermediate isokinetics at each point, weighted averaging of the cumulative isokinetics is necessary since all points are not equal, and determined by using the dry standard meter volume collected at each point to weight the cumulative average. Intermediate isokinetics and dry standard meter volumes are found at each point. At each point the cumulative sum is found of each value and the quotient of the two used to determine the cumulative isokinetics for each residual point (n).

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{nw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D\,(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s\,(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12 \text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D\,(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

$V_{wsg(std)}$ = 88.90 g x 0.04715 ft^3/g = 4.192 scf

Standard Meter Volume (dscf)

$$V_{m(std)}(dscf) = \frac{K_1 \times Y \times V_m \times \left(P_b + \frac{\Delta H_{avg}}{13.6}\right)}{(t_m)_{avg} + T_u}$$

$$V_{m(std)} = \frac{\frac{17.65\ ^\circ R}{in.\ Hg} \times 0.99 \times 42.32\ dcf \times \left(30.14\ in.\ Hg + \frac{0.34\ in.\ H_2O}{13.6\ in.\ H_2O / in.\ Hg}\right)}{95.69\ ^\circ F + 460\ ^\circ R} = 39.93\ dscf$$

Calculated Moisture Content (%)

$$B_{ws(calc)}(\%) = 100 \times \frac{V_{wsg(std)}}{V_{wsg(std)} + V_{m(std)}}$$

$$B_{ws(calc)} = 100 \times \frac{4.19\ dscf}{4.19\ dscf + 39.93\ dscf} = 9.50\ \%$$

EMISSION DATA RECORDS

Operating Data Base+DB Load and Auxiliary Boiler (provided by Cricket Valley Energy Center LLC) Opacity

Opacity testing was pursued after the fuel gas flow meter mode of operation was corrected to Mode 1 (natural gas). No corrections necessary for measured fuel flow rate values.

NOx, CO, VOC, and NH_3

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

40 CFR 60, Method 2G, Section 8.11.1 (but applies to all Method 2 type static pressure measurements):
If a Type S probe is used for this measurement, position the probe at or between any traverse point(s) and rotate the probe until a null differential pressure reading is obtained. Disconnect the tubing from one of the pressure ports; read and record the ΔP. For pressure devices with one-directional scales, if a deflection in the positive direction is noted with the negative side disconnected, then the static pressure is positive. Likewise, if a deflection in the positive direction is noted with the positive side disconnected, then the static pressure is negative.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Notes:

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

EMISSION DATA RECORDS

Reference Method Data
Base+DB Load
NOx, CO, VOC, and NH_3

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

40 CFR 60, Method 2G, Section 8.11.1 (but applies to all Method 2 type static pressure measurements):
If a Type S probe is used for this measurement, position the probe at or between any traverse point(s) and rotate the probe until a null differential pressure reading is obtained. Disconnect the tubing from one of the pressure ports; read and record the ΔP. For pressure devices with one-directional scales, if a deflection in the positive direction is noted with the negative side disconnected, then the static pressure is positive. Likewise, if a deflection in the positive direction is noted with the positive side disconnected, then the static pressure is negative.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Notes:

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

EMISSION DATA RECORDS

Reference Method Data
Base+DB Load and Auxiliary Boiler
Opacity

Following completion of the stack emission test program for Unit #U-00001, it was discovered that the U-00001 fuel gas flow meter operation was tied to a “test mode” (Mode 0) setting, and not the expected “natural gas mode” setting (Mode 1). Further investigations of the impact of this setting, indicate that the initial Mode 0 fuel gas flow results have a positive bias of 1.5%. Consequently, the original fuel gas flow results (see U-00001-supplied operational fuel gas data) have been reduced by 1.5%. The operating mode of the Unit 1 gas flowmeter has been reset to the correct Mode 1 (natural gas).

(Zero Ambient Nitrogen)

Cylinder Number:	CC731563	**Certification Date:**	12/12/2019
Product ID Number:	121026	**Expiration Date:**	12/10/2027
Cylinder Pressure:	1900 PSIG	**MFG Facility:**	RBTGS-Shreveport-LA
COA #	CC731563.20191212-0	**Lot Number:**	CC731563.20191212
Customer PO. NO.:		**Tracking Number:**	098934324
Customer:		**Previous Certification Dates:**	

This mixture is for laboratory use only, not for drug, household or other use.
This mixture is certified in Mole % to be within ±2% of the actual number reported with a confidence of 95%.
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

Composing Material: Zero Ambient Nitrogen, Cert., Sz152

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

APPENDIX D

QUALITY ASSURANCE AND QUALITY CONTROL DATA

QA/QC PROGRAM

AIR HYGIENE ensures the quality and validity of its emission measurement and reporting procedures through a rigorous quality assurance (QA) program. The program is developed and administered by an internal QA team and encompasses six major areas:

1. Field Qualifications
2. QA reviews of reports, laboratory work, and field testing;
3. Equipment calibration and maintenance;
4. Chain-of-custody;
5. Training; and
6. Knowledge of current test methods

Field Qualifications

Air Hygiene personnel are required to gain and maintain competence with testing methods and techniques according to their job titles and the roles they play during field testing events. Qualifications for each job description include:

Staff Technician - An entry level position with responsibility to test on the stack by performing duties that include: keep trucks and trailers stocked and clean, travel to and from job site, be the “hands of the test” on the stack; stay on a stack during the sample test, set up and tear down equipment on-site, perform maintenance on equipment in the shop and on-site.

Test Technician or Specialist - Acts as the “hands of the test” on the stack by performing duties that include: stay on a stack during the sample test, migrate to the testing trailer and learn the different analyzers and testing methods used on site, set up and tear down testing equipment on site, learn the system for testing from Testing Managers and Project Managers, travel to and from job site; including driving responsibilities under DOT requirements, follow directions of Testing Managers and Project Managers, learn the proper way to conduct on-site test of stationary stacks

Test Manager or Engineer - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Test Managers must hold at least one QSTI certificate.

Project Manager - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Project Managers typically hold QSTI certificates in Groups 1 through 4.

QA Reviews

Air Hygiene’s review procedure includes review of each source test report, along with laboratory and fieldwork, by the QA Team. The most important review is the one that takes place before a test program begins. The QA Team works closely with technical division personnel to prepare and review test protocols. Test protocol review includes selection of appropriate test procedures, evaluation of interferences or other restrictions that might preclude use of standard test procedures, and evaluation and/or development of alternate procedures.

Equipment Calibration and Maintenance

The equipment used to conduct the emission measurements is maintained according to the manufacturer’s instructions to ensure proper operation. In addition to the maintenance program, calibrations are carried out on each measurement device according to the schedule outlined by the Environmental Protection Agency. Quality control checks are also conducted in the field for each test program. In conformance with ASTM D7036 Section 15.3.15, all metering and monitoring equipment meets or exceeds the uncertainty criteria contained in the method language that pertains to that equipment.

Chain-of-Custody
Air Hygiene maintains full chain-of-custody documentation on all samples and data sheets. In addition to normal documentation of changes between field sample custodians, laboratory personnel, and field test personnel, Air Hygiene documents every individual who handles any test component in the field (e.g., probe wash, impinger loading and recovery, filter loading and recovery, etc.). Samples are stored in a locked area to which only Air Hygiene personnel have access. Field data sheets are secured at Air Hygiene's offices upon return from the field.

Training
Personnel's training is essential to ensure quality testing. Air Hygiene has formal and informal training programs, which include:

1. Attendance at EPA-sponsored training courses
2. Enrollment in EPA correspondence courses
3 A requirement for all technicians to read and understand Air Hygiene's QA manual
4. In-house training and QA meetings on a regular basis
5. Maintenance of training records

Knowledge of Current Test Methods
With the constant updating of standard test methods and the wide variety of emerging test procedures, it is essential that any qualified source tester keep abreast of new developments. Air Hygiene subscribes to services, which provide updates on EPA reference methods, rules, and regulations. Additionally, source test personnel regularly attend and present papers at testing and emission-related seminars and conferences. Air Hygiene personnel maintain membership in the Air and Waste Management Association and the American Industrial Hygiene Association.

Reproduction and Distribution Policy
Reproducing portions of this test report may omit critical or substantial documentation or be taken out of context and due care must be exercised in this regard. Furthermore, this test report and its associated data shall not be reproduced in full or in part without the written consent of the customer.

Data Provided by Client
Data provided by the Client is clearly identified in the report. Air Hygiene accepts data provided by the Client as accurate.

COMBUSTION TESTING QUALITY ASSURANCE ACTIVITIES

In conformance with ASTM D7036 Section 15.3.11 and 13, all testing was performed without any real or apparent errors, with the exception of those that would be listed in Section 2.0 of this report. In addition, all testing was conducted according to the approved testing protocol, test methods, Air Hygiene Quality Manual, or ASTM D7036, with the exception of specifics noted in Section 2.0 of this report. A number of quality assurance activities were undertaken before, during, and after this testing project. This section of the report combined with the documentation in Appendix C describes each of those activities.

Each instrument's response was checked and adjusted in the field prior to the collection of data via multi-point calibration. The instrument's linearity was checked by adjusting its zero and span responses to zero nitrogen and an upscale calibration gas in the range of the expected concentrations. The instrument response was then challenged with other calibration gases of known concentration and accepted as being linear if the response of the other calibration gases agreed within plus or minus two percent of the range of predicted values. NO_2 to NO conversion was checked via direct connect with an EPA Protocol certified concentration of NO_2 in a balance of air or nitrogen. Conversion was verified to be between 90 and 110 percent.

After each test run, the analyzers were checked for zero and span drift. This allowed each test run to be bracketed by calibrations and documents the precision of the data just collected. The criterion for acceptable data is that the instrument drift is no more than three percent of the full-scale response. The quality assurance worksheets in the following pages summarize all multipoint calibration checks and zero to span checks performed during the tests. These worksheets (as prepared from the data records of Appendix A) show that no drifts in excess of three percent occurred in the zero to span checks following each test run.

The sampling systems were leak checked by demonstrating that a vacuum greater than 10 in Hg could be held for at least one minute with a decline of less than one inch of Hg. A leak test was conducted after the sample system was set up and before the system was dismantled. This test was conducted to ensure that ambient air had not diluted the sample. Any leakage detected prior to the tests would be repaired and another leak check conducted before testing commenced. No leaks were found during the pre or post-test leak checks.

The absence of leaks in the sampling system was also verified by a sampling system bias check. The sampling system's integrity was tested by comparing the responses of the analyzers to the calibration gases introduced via two paths. The first path was directly into the analyzer and the second path via the sample system at the sample probe. Any difference in the instrument responses by these two methods was attributed to sampling system bias or leakage. The criterion for acceptance is agreement within five percent of the span of the analyzer.

The control gases used to calibrate the instruments were analyzed and certified by the compressed gas vendors to plus or minus one percent accuracy for all gases. EPA Protocol No. 1 was used, where applicable to assign the concentration values traceable to the National Institute of Standards and Technology (NIST), Standard Reference Materials (SRM's). The gas calibration sheets as prepared by the vendor are contained in Appendix C.

Air Hygiene collected and reported the enclosed test data in accordance with the procedures and quality assurance activities described in this test report. Air Hygiene makes no warranty as to the suitability of the test methods. Air Hygiene also assumes no liability relating to the interpretation and use of the test data.

Accredited Laboratory

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

Broken Arrow, OK

for technical competence in the field of

Environmental Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 *General requirements for the competence of testing and calibration laboratories*. This laboratory also meets the A2LA *R219 – Specific Requirements – TNI Field Sampling and Measurement Organization Accreditation Program*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (*refer to joint ISO-ILAC-IAF Communiqué dated April 2017*).

Presented this 18th day of December 2019

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.01
Valid to August 31, 2021

For the tests to which this accreditation applies, please refer to the laboratory's Envrionmental Scope of Accreditation.

STACK TESTING ACCREDITATION COUNCIL

American Association for Laboratory Accreditation

Accredited Air Emission Testing Body

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

In recognition of the successful completion of the joint A2LA and Stack Testing Accreditation Council (STAC) evaluation process, this laboratory is accredited to perform testing activities in compliance with ASTM D7036:2004 - Standard Practice for Competence of Air Emission Testing Bodies.

Presented this 18th day of December 2019.

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.02
Valid to August 31, 2021

This accreditation program is not included under the A2LA ILAC Mutual Recognition Arrangement.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Filters are placed in a dessicator for 24 hours minimum prior to beginning weighing cycle.
Filters are not to be exposed to lab atmosphere for > 2 minutes at a relative humidity of≥50 %.
Verification Weight 5mg S/N 1000144533
Verification Weight 100mg S/N 29785
Verification Weight 300mg S/N 1000112492

Specific data from the lab regarding the filter weights reported at the RDL and noted as “negative weight observed”.

Comparison of actual Lab Reported Filter Loss to the gains in the sample train sections just prior to and just after the filter. The total gains in each of these sections always accounts for the filter loss. Air Hygiene concluded that the frayed filter edges either ended up in the section prior to the filter and/or the section just downstream of the filter.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

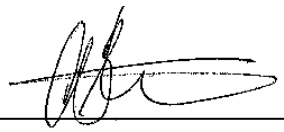
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.



Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Notes:

For Calibration Factor Y, the ratio of the reading of the calibration meter to the dry gas meter,acceptable tolerance of individual values from the average is +/- 0.02. For Orifice Calibration Factor dH@, the orifice differential pressure in inches of H_20 that equates to 0.75 cfm of air at 68 °F and 29.92 inches of Hg, acceptable tolerance of individual values from the average is +/- 0.2. For valid test results, the Actual Vacuum should be 1 to 2 in. Hg greater than the Theoretical Critical Vacuum shown above. The Critical Orifice Coefficient, K', must be entered in English units, (ft)^3*(deg R)^0.5/((in.Hg)*(min)).

Standard for Calibration of Console Thermocouple Systems

40 CFR, Part 60
Appendix A, Method 5
10.3.2 The temperature data recorded in the field shall be considered valid. If, during calibration, the absolute temperature measured with the sensor being calibrated and the reference sensor **agree within 1.5 percent**, the temperature data taken in the field shall be considered valid.

Standard for Calibration of Individual Thermocouples

EMC, ALT-011: After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer (either ASTM reference thermometer or a thermometer that has been calibrated against an ASTM reference thermometer). The temperatures of the thermocouple and reference thermometers shall **agree to within ±2°F**.

Check the continuity of the thermocouple by subjecting it to a change in the temperature (e.g.., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections (noted by a wrong change in the temperature).

Notes:

For Calibration Factor Y, the ratio of the reading of the calibration meter to the dry gas meter,acceptable tolerance of individual values from the average is +/- 0.02. For Orifice Calibration Factor dH@, the orifice differential pressure in inches of H_20 that equates to 0.75 cfm of air at 68 °F and 29.92 inches of Hg, acceptable tolerance of individual values from the average is +/- 0.2. For valid test results, the Actual Vacuum should be 1 to 2 in. Hg greater than the Theoretical Critical Vacuum shown above. The Critical Orifice Coefficient, K', must be entered in English units, (ft)^3*(deg R)^0.5/((in.Hg)*(min)).

10.3.2 The temperature data recorded in the field shall be considered valid. If, during calibration, the absolute temperature measured with the sensor being calibrated and the reference sensor **agree within 1.5 percent**, the temperature data taken in the field shall be considered valid.

Standard for Calibration of Individual Thermocouples

EMC, ALT-011: After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer (either ASTM reference thermometer or a thermometer that has been calibrated against an ASTM reference thermometer). The temperatures of the thermocouple and reference thermometers shall **agree to within ±2°F**.

Check the continuity of the thermocouple by subjecting it to a change in the temperature (e.g.., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections (noted by a wrong change in the temperature).

Emissions Compliance Test
General Electric, 7F.05, Unit #U-00002
Cricket Valley Energy Center LLC
Cricket Valley Energy Center
Dover Plains, New York
March 9-11, 2020

1.0 INTRODUCTION

Air Hygiene International, Inc. (Air Hygiene) has completed the Emissions Compliance Test for nitrogen oxides (NOx), carbon monoxide (CO), total hydrocarbons/volatile organic compounds (THC/VOC), sulfur dioxide (SO_2) [by fuel analysis], ammonia (NH_3), particulate matter (PM_{10}), sulfuric acid mist (SAM), opacity / visual emissions (VE), flow, moisture (H_2O), carbon dioxide (CO_2), and oxygen (O_2) from the exhaust of the General Electric, 7F.05, Unit #U-00002 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. This report details the background, results, process description, and the sampling/analysis methodology of the stack sampling survey conducted on March 9-11, 2020.

1.1 TEST PURPOSE AND OBJECTIVES

The purpose of the test was to conduct an initial compliance emission test to document levels of selected pollutants at two test loads, base loaded with duct burners on and base loaded with duct burners off (Base+DB and Base). The information will be used to confirm compliance with the operating permit issued by the New York State Department of Environmental Conservation (NYSDEC). The specific objective was to determine the emission concentrations and rates of NOx, CO, THC/VOC, SO_2 [fuel analysis], NH_3, PM_{10}, SAM, VE, flow, H_2O, CO_2, and O_2 from the exhaust of Cricket Valley Energy Center LLC's General Electric, 7F.05, Unit #U-00002 at Base+DB and Base.

1.2 SUMMARY OF TEST PROGRAM

The following list details pertinent information related to this specific project:

1.2.1 Participating Organizations
- New York State Department of Environmental Conservation (NYSDEC)
- Cricket Valley Energy Center LLC
- Bechtel Corporation
- Air Hygiene

1.2.2 Industry
- Electric Utility / Electric Services

1.2.3 Air Permit Requirements
- Permit Number: 3-1326-00275/00009

1.2.4 Plant Location
- Cricket Valley Energy Center in Dover Plains, New York
  - GPS Coordinates [Latitude 41.67721, Longitude -73.57992]
  - Physical Address: 2241 ST RTE 22, Dover Plains, New York 12522
  - Federal Registry System / Facility Registry Service (FRS) No. – 110043340364
  - Source Classification Code (SCC) – 10200602

1.2.5 Equipment Tested
- General Electric, 7F.05, Unit #U-00002

1.2.6 Emission Points

- Exhaust from the General Electric, 7F.05, Unit #U-00002
- For all gases, one sample point in the exhaust duct from the General Electric, 7F.05, Unit #U-00002, determined after conducting a 12-point stratification test
- For all PM_{10} testing, 12 sampling points in the exhaust duct from the General Electric, 7F.05, Unit #U-00002
- For all SAM testing, one sample point in the exhaust duct from the General Electric, 7F.05, Unit #U-00002
- For opacity, one sample visual observation point from the exit of the exhaust duct to the atmosphere from the General Electric, 7F.05, Unit #U-00002

1.2.7 Emission Parameters Measured

Notes: [1]Air permit specifically indicates design capacity heat input of 2395.7 MMBtu/hr [ISO Conditions, 1 atm (29.923 in Hg), temperature 15 C or 59 F, and RH 60%] for the gas turbine. [2]Air permit specifically indicates design capacity heat input of 247 mmBtu/hr [ISO Conditions, 1 atm (29.923 in Hg), temperature 15 C or 59 F, and RH 60%] for the duct burner.

The results of all measured pollutant emissions were below the required limits. All testing was conducted according to the approved testing protocol. All testing was performed without any real or apparent errors with the following exceptions:

The PM_{10} filter weights were reported by the laboratory at the reportable detection limit (RDL). Supplemental laboratory data was provided and additional data analysis indicated minor filter losses, which were accounted for in either the sample train section cleanup just prior to the filter or the sample train cleanup in the section just after the filter. As a result, the PM results are considered valid with accounting for all minor filter weight losses in other fractions of the sample train results.

The SAM analysis was conducted by titration, per the requirements of CTM-013 with all results reported below the reportable detection limits (RDLs). However, when reporting emission rates using the titration based RDL values, the SAM results exceeded permitted limits. To remedy, the SAM analysis was also conducted by ion chromatography (IC). The supplemental IC analysis (Appendix D) yielded lower RDLs and also all results that were below the permitted limits. Emission rates were calculated based on the supplemental IC data.

3.0 SOURCE OPERATION

3.1 PROCESS DESCRIPTION

Cricket Valley Energy Center LLC owns and operates the Cricket Valley Energy Center located at 2241 ST RTE 22 in Dover Plains, New York. Located on the Cricket Valley Energy Center are three General Electric 7F.05 Combustion Turbine Generators (CTGs), designated as Emission Units U-00001, U-00002, and U-00003. The CTGs and associated heat recovery steam generators (HRSGs) which are equipped with dry low NOx burners in combination with selective catalytic reduction systems (SCRs). The CTG-HRSGs are also equipped with oxidation catalysts which reduce CO and VOC emissions.

3.2 SAMPLING LOCATION

The sample ports were located approximately vertical, circular and measures 19 feet (ft) (228 inches) in diameter at the test ports which are approximately 265.8 ft above grade level with an exit elevation of approximately 282.5 ft above grade level. The test ports are located approximately 70.8 ft (850 inches) downstream and approximately 16.7 ft (200.4 inches) upstream from the nearest disturbances. Air Hygiene has field verified the measurable dimensions. Non-field verified dimensions are provided by Cricket Valley Energy Center LLC. All exhaust samples for gaseous emissions were continuously drawn from the exhaust system at the sample ports from a single point determined after conducting a stratification test. During the stratification test three points were traversed from each of the four ports. The probe was allowed to remain at a point for two times the system response time. For PM_{10} testing, an initial velocity traverse was performed across the stack from 12 total points at each test load. All PM_{10} sampling occurred from the same 12 points. All SAM testing occurred from a simple sample point. All opacity observations were made by viewing the point where the exhaust system exited to the atmosphere at the top of the exhaust stack.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

4.1 TEST METHODS

The emission test on the General Electric, 7F.05, Unit #U-00002 at the Cricket Valley Energy Center was performed following United States Environmental Protection Agency (EPA) methods described by the Code of Federal Regulations (CFR). Table 4.1 outlines the specific methods performed on March 9-11, 2020.

TABLE 4.1

4.2 INSTRUMENT CONFIGURATION AND OPERATIONS FOR GAS ANALYSIS

The sampling and analysis procedures used during these tests conform with the methods outlined in the Code of Federal Regulations (CFR), Title 40, Part 60, Appendix A, Methods 1, 2, 3A, 4, 7E, 9, 10, 18, 19, 25A; 40 CFR 51, Appendix M, Methods 201A and 202; 40 CFR 63, Appendix A, Method 320; Conditional Test Method (CTM)-013 [Method 8A]; ASTM 5504; and GPA 2261.

Figure 4.1 depicts the sample system used for the real-time gas analyzer tests. The gas sample was continuously pulled through the probe and transported, via heat-traced Teflon® tubing, to a heated head pump and into the FTIR then to a stainless-steel minimum-contact condenser designed to dry the sample. Transportation of the sample, through Teflon® tubing, continued into the sample manifold within the mobile laboratory via a stainless steel/Teflon® diaphragm pump. From the manifold, the sample was partitioned to the real-time analyzers through rotameters that controlled the flow rate of the sample. Exhaust samples were routed to the wet based analyzer prior to gas conditioning.

Figure 4.1 shows that the sample system was also equipped with a separate path through which a calibration gas could be delivered to the probe and back through the entire sampling system. This allowed for convenient performance of system bias checks as required by the testing methods.

All instruments were housed in a climate controlled, trailer-mounted mobile laboratory. Gaseous calibration standards were provided in aluminum cylinders with the concentrations certified by the vendor. EPA Protocol No. 1 was used to determine the cylinder concentrations where applicable (i.e. NOx calibration gases).

Table 4.2 provides a description of the analyzers used for the instrument portion of the tests. All data from the continuous monitoring instruments were recorded on a Logic Beach Portable Data Logging System which retrieves calibrated electronic data from each instrument every one second and reports an average of the collected data every 30 seconds. For target compounds measured with the Fourier transform infrared (FTIR) spectrometer,

interferograms consisting of 27 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations. Spectral data was analyzed by the MKS MG2000 software.

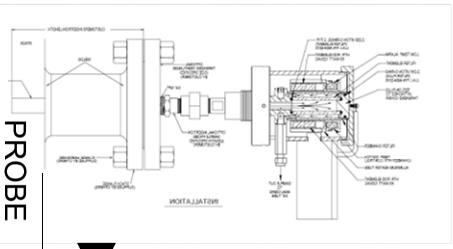
Figure 4.2 represents the sample system used for the PM_{10} tests. A heated stainless-steel probe with a glass liner and stainless-steel nozzle was inserted into the sample ports of the stack to extract gas measurements from the emission stream through a filter and glass impinger train. Flow rates are monitored with oil filled manometers and total sample volumes are measured with a dry gas meter. Glassware that is used to collect and analyze Method 202 condensable particulate samples is cleaned prior to the test with soap and water, and rinsed using tap water, deionized water, acetone, and finally, hexane. After cleaning, Air Hygiene incorporates a glassware bake at 300ºC for six hours rather than the alternative of collecting a field train proof blank.

Figure 4.3 represents the sample system used for the SAM tests. A heated stainless-steel probe with a glass liner was inserted into a sample port of the stack to extract gas measurements from the emission stream through a filter and glass impinger train. Flow rates are monitored with oil filled manometers and total sample volumes are measured with a dry gas meter.

The stack gas analysis for O_2 and CO_2 concentrations was performed in accordance with procedures set forth in EPA Method 3A. The O_2 analyzer uses a paramagnetic cell detector and the CO_2 analyzer uses a continuous nondispersive infrared analyzer.

EPA Method 7E was used to determine concentrations of NOx. A chemiluminescent analyzer was used to determine the nitrogen oxides concentration in the gas stream. A NO_2 in nitrogen certified gas cylinder was used to verify at least a 90 percent NO_2 conversion on the day of the test.

CO emission concentrations were quantified in accordance with procedures set forth in EPA Method 10. A continuous nondispersive infrared (NDIR) analyzer was used for this purpose.



THC emission concentrations were quantified in accordance with procedures set forth in EPA Method 25A. A continuous flame ionization (FID) analyzer was used for this purpose. THC emissions concentrations were below VOC limits and all assumed as VOCs. EPA Method 18 for Tedlar bag sampling and analysis of methane and ethane content was not analyzed or subtracted from the THC concentrations to determine VOC concentrations.

An MKS Instruments - MultiGas™ Fourier Transform Infrared (FTIR) spectrometer, or equivalent, was used for NH_3 analysis per EPA Method 320. The FTIR spectrometer spectral resolution was 0.5 cm^{-1}. The system employed a silicon carbide infrared source at 1200ºC, a helium neon reference laser, beam splitters, potassium bromide (KBr) cell window, front-surface optical transfer mirrors, and multi-pass absorption cells. MCT detectors were used and cooled with liquid nitrogen in order to maintain a constant temperature of 77 Kelvin. The approximately 5.11-meter multi-pass path cells incorporated aspheric, aberration-correcting mirrors to increase the optical throughput and the detection sensitivity. Transducers and thermocouples were connected directly to the insulated sample cells that provide the pressure and temperatures of the sample streams. During testing, the temperature of the absorption cells was set at 191ºC. Elevated temperature prevented gas condensation within the cell and minimized compound adhesion to the cell walls and mirrors. The volume of the absorption cell was 0.5 liters, so at a sample gas flow rate of 10.0 liters per minute, the sample gas in the cell is refreshed at least times each minute. Interferograms consisting of 27 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations.

Calculations, Formulas, and Constants

The following information supports the spreadsheets for this testing project.

Given Data:

Ideal Gas Conversion Factor = 385.23 SCF/lb-mol at 68 deg F & 14.696 psia

Fuel Heating Value is based upon Air Hygiene's fuel gas calculation sheet. All calculations are based upon a correction to 68 deg F & 14.696 psia

High Heating Values (HHV) are used for the Fuel Heating Value, F-Factor, and Fuel Flow Data per EPA requirements.

1. Corrected Raw Average (C_{Gas}), 40CFR60, App. A, RM 7E, Eq. 7E-5 (08/15/06)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$

2. Correction to % O_2, 40CFR60, App. A, RM 20, Eq. 20-5 (11/26/02)

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$

3. Correction to % O_2 and ISO Conditions

$$C_{ISO} = C_{Adj} \times \sqrt{\frac{P_r}{P_o}} \times e^{(19 \times (H_O - 0.00633))} \times \left(\frac{288}{T_a}\right)^{1.53}$$

4. Method 19 stack exhaust flow (scfh) [ref. EPA EMC FAQ Method 19]

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000}\right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}}\right)$$

5. Emission Rate in lb/hr

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

6. Emission Rate in tons per year

$$E_{ton/yr} = \frac{E_{lb/hr} \times hr_{year}}{2000}$$

7. Emission Concentration in lb/MMBtu (O_2 based)

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$

8. Emission Concentration in g/hp*hr

$$E_{g/hp \cdot hr} = \frac{E_{lb/hr} \times 453.6}{mw \times 1341.022} \; or \; \frac{E_{lb/hr} \times 453.6}{hp}$$

RM 7E, (08-15-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

ACE = Analyzer calibration error, percent of calibration span.
B_{WS} = Moisture content of sample gas as measured by Method 4 or other approved method, percent/100.
C_{Avg} = Average unadjusted gas concentration indicated by data recorder for the test run.
C_D = Pollutant concentration adjusted to dry conditions.
C_{Dir} = Measured concentration of a calibration gas (low, mid, or high) when introduced in direct calibration mode.
C_{Gas} = Average effluent gas concentration adjusted for bias.
C_M = Average of initial and final system calibration bias (or 2-point system calibration error) check responses for the upscale calibration gas.
C_{MA} = Actual concentration of the upscale calibration gas, ppmv.
C_O = Average of the initial and final system calibration bias (or 2-point system calibration error) check responses from the low-level (or zero) calibration gas.
C_S = Measured concentration of a calibration gas (low, mid, or high) when introduced in system calibration mode.
C_{SS} = Concentration of NOx measured in the spiked sample.
C_{Spike} = Concentration of NOx in the undiluted spike gas.
C_{Calc} = Calculated concentration of NOx in the spike gas diluted in the sample.
C_V = Manufacturer certified concentration of a calibration gas (low, mid, or high).
C_W = Pollutant concentration measured under moist sample conditions, wet basis.
CS = Calibration span.
D = Drift assessment, percent of calibration span.
E_p = The predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response.
Eff_{NO2} = NO_2 to NO converter efficiency, percent.
H = High calibration gas, designator.
L = Low calibration gas, designator.
M = Mid calibration gas, designator.
NOFinal = The average NO concentration observed with the analyzer in the NO mode during the converter efficiency test in Section 16.2.2.
NOxCorr = The NOx concentration corrected for the converter efficiency.
NOxFinal = The final NOx concentration observed during the converter efficiency test in Section 16.2.2.
NOxPeak = The highest NOx concentration observed during the converter efficiency test in Section 16.2.2.
Q_{Spike} = Flow rate of spike gas introduced in system calibration mode, L/min.
Q_{Total} = Total sample flow rate during the spike test, L/min.
R = Spike recovery, percent.
SB = System bias, percent of calibration span.
SB_i = Pre-run system bias, percent of calibration span.
SB_f = Post-run system bias, percent of calibration span.
SB / D_{Alt} = Alternative absolute difference criteria to pass bias and/or drift checks.
SCE = System calibration error, percent of calibration span.
SCE_i = Pre-run system calibration error, percent of calibration span.
SCE_{final} = Post-run system calibration error, percent of calibration span.
Z = Zero calibration gas, designator.

EXAMPLE CALCULATIONS (FFACTOR)

RM 19, (02-27-14),
2.0 Summary of Method,
2.1 Emission Rates. Oxygen (O_2) or carbon dioxide (CO_2) concentrations and appropriate F factors (ratios of combustion gas volumes to heat inputs) are used to calculate pollutant emission rates from pollutant concentrations.

RM 19, (02-27-14),
12.2 Emission Rates of PM, SO_2, and NOx. Select from the following sections the applicable procedure to compute the PM, SO_2, or NOx emission rate (E) in lb/MMBtu. The pollutant concentration must be in lb/scf and the F factor must be in scf/MMBtu. If the pollutant concentration (C) is not in the appropriate units, use Table 19–1 in Section 17.0 to make the proper conversion. An F factor is the ratio of the gas volume of the products of combustion to the heat content of the fuel. The dry F factor (F_d) includes all components of combustion less water, the wet F factor (F_w) includes all components of combustion, and the carbon F factor (F_c) includes only carbon dioxide.

EXAMPLE CALCULATIONS (INFORMATION)

Specific Humidity (RH_{sp})

Note: RHsp (gr/lb) calculated using temperature, relative humidity, and barometric pressure with psychrometric chart, psychrometric calculator, or built in psychrometric algorithm.

$$RH_{sp}(lb/lb) = \left[\left(\frac{gr}{lb}\right) \times \frac{lb}{7000\,gr}\right]$$

RH_{sp}= $\frac{20.48\ gr}{lb}$ x $\frac{1\ lb}{7000\ gr}$ = 0.002926 $\frac{lb\ H_2O}{lb\ Air}$

Fuel Flow Conversion (Q_f)

Note: Qf(lb/min) is a value obtained from the source operator.

$$Q_f = \left[Q_f \times G \times \left(\frac{1}{MW_{Fuel}}\right)\right]$$

Q_f = $\frac{1{,}616.74\ lb}{min}$ x $\frac{60\ min}{hr}$ x $\frac{385.23\ ft^3}{lb\text{-}mol}$ x $\frac{lb\text{-}mol}{17.02\ lb}$ = 2,195,187 SCFH

Heat Rate (MMBtu/hr)

$$HR = \frac{HHV_{DRY} \times Q_f}{1{,}000{,}000}$$

Heat Rate = $\frac{1{,}007.94\ Btu}{SCF}$ x $\frac{2{,}195{,}186.52\ SCF}{hr}$ x $\frac{MMBtu}{10^6\ Btu}$ = $\frac{2{,}212.62\ \ MMBtu}{hr}$

EXAMPLE CALCULATIONS (CALIBRATION)

Analyzer Calibration Error

RM 7E, (02-27-14), 12.2 Analyzer Calibration Error. For non-dilution systems, use Equation 7E-1 to calculate the analyzer calibration error for the low-, mid-, and high-level calibration gases. (calc for NOx analyzer mid gas, if applicable)

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100$$ Eq. 7E-1

ACE = $\frac{5.05\ ppm - \ 4.91\ ppm}{8.90\ ppm}$ x 100 = 1.57 %

Calibration Error and Estimated Point, RM 25A, THC/VOC Analyzer

RM 25A, (02-27-14), 8.4 Calibration Error Test. Immediately prior to the test series (within 2 hours of the start of the test), introduce zero gas and high-level calibration gas at the calibration valve assembly. Adjust the analyzer output to the appropriate levels, if necessary. Calculate the predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response. Then introduce low-level and mid-level calibration gases successively to the measurement system. ... These differences must be less than 5 percent of the respective calibration gas value. (calc for THC/VOC analyzer mid gas, if applicable)

$$E_P = \frac{C_{Dir(H)} - C_{Dir(Z)}}{C_{V(H)} - C_{V(Z)}} \times C_{Dir(M)} + C_{Dir(Z)}$$

Eq. of a line
y=mx+b

E_p = $\frac{8.82\ ppm - \ 0.00\ ppm}{8.77\ ppm - \ 0.00\ ppm}$ x 4.90 ppm + 0.00 = 4.93 ppm

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100$$ Eq. 7E-1

$ACE_{VOC(}$ = $\frac{4.73\ ppm - \ 4.93\ ppm}{4.90\ ppm}$ x 100 = -4.05 %

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (BIAS, DRIFT, AND CORRECTED RAW AVERAGE)

System Bias

RM 7E, (02-27-14), 12.3 System Bias. For non-dilution systems, use Equation 7E-2 to calculate the system bias separately for the low-level and upscale calibration gases. (calc for NOx analyzer upscale gas, Run 1 initial bias, if applicable)

$$SB = \left(\frac{C_S - C_{Dir}}{CS}\right) \times 100$$ Eq. 7E-2

SB = $\frac{4.84 \text{ ppm} - 5.05 \text{ ppm}}{8.90 \text{ ppm}}$ x 100 = -2.36 %

Drift Assessment

RM 7E, (02-27-14), 12.5 Drift Assessment. Use Equation 7E-4 to separately calculate the low-level and upscale drift over each test run. (calc for NOx analyzer upscale drift, Run 1, if applicable)

$$D = \left|SB_{final} - SB_i\right|$$ Eq. 7E-4

D = | -1.35 % - -2.36 % | = 1.01 %

Alternative Drift and Bias

RM 7E, (02-27-14), 13.2 / 13.3 System Bias and Drift. Alternatively, the results are acceptable if |Cs – Cdir| is ≤ 0.5 ppmv or if |Cs – Cv| is ≤ 0.5 ppmv (as applicable). (calc for NOx analyzer initial upscale, Run 1, if applicable)

$$SB / D_{Alt} = \left|C_S - C_{Dir}\right|$$ Eq. Section 13.2 and 13.3

SB / D_{Alt} = | 4.84 ppm - 5.05 ppm | = 0.21 ppm

Bias Adjusted Average

RM 7E, (02-27-14), 12.6 Effluent Gas Concentration. For each test run, calculate Cavg, the arithmetic average of all valid NOx concentration values (e.g., 1-minute averages). Then adjust the value of Cavg for bias, using Equation 7E-5b. (calc for NOx analyzer, Run 1, if applicable)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$ Eq. 7E-5b

C_{Gas} = $\left(2.08 \text{ ppm} - -0.08 \text{ ppm}\right)$ $\left(\frac{4.91 \text{ ppm}}{4.89 \text{ ppm} - -0.08 \text{ ppm}}\right)$ = 2.14 ppm

EXAMPLE CALCULATIONS (RUNS)

Moisture Correction

RM 7E, (02-27-14), 12.10 Moisture Correction. Use Equation 7E-10 if your measurements need to be corrected to a dry basis. (calc for NOx analyzer, Run 1, if applicable) Note: Calculations may not match as Run 1 results are typically also bias adjusted

$$C_D = \frac{C_W}{1 - B_{WS}}$$ Eq. 7E-10

C_D = $\frac{1.97 \text{ ppmvw}}{1 - 0.08}$ = 2.14 ppmvd or inversely, $C_W = C_D \times \left(1 - B_{WS}\right)$

C_W = 2.14 ppmvd x $\left(1 - 0.08\right)$ = 1.97 ppmvw

Diluent-Corrected Pollutant Concentration, O_2 Based

RM 20, (11-26-02), 7.3.1 Correction of Pollutant Concentration Using O_2 Concentration. Calculate the O_2 corrected pollutant concentration, as follows: (calc for NOx gas, Run 1, if applicable) [now contained in applicable Subpart]

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$ Eq. 20-4

C_{adj} = 2.14 ppm x $\left(\frac{20.9\% - 15.00\ \%}{20.9\% - 13.07\ \%}\right)$ = 1.61 ppm@15%O_2

Nomenclature

- %CO = carbon monoxide concentration (%)
- $\%CO_2$ = carbon dioxide concentration (%)
- $\%N_2$ = nitrogen concentration (%)
- $\%O_2$ = oxygen concentration (%)
- $\%O_{2,wet}$ = Oxygen content of gas stream, % by volume of wet gas. (Note: The oxygen percentage used in Method 201A, Equation 3 is on a wet gas basis. That means that since oxygen is typically measured on a dry gas basis, the measured percent O2 must be multiplied by the quantity $(1 - B_{ws})$ to convert to the actual volume fraction. Therefore, $\%O_{2,wet} = (1 - B_{ws}) * \%O_{2, dry}$)
- $(\%EA)_{avg}$ = average excess air (%)
- $(F_o)_{avg}$ = average calculated fuel factor
- $[(\Delta p)^{0.5}]_{avg}$ = Average of square roots of the velocity pressures measured during the preliminary traverse, inches W.C.
- μ = Gas viscosity, micropoise
- 12.0 = Constant calculated as 60 percent of 20.5 square inch cross-sectional area of combined cyclone head, square inches
- 17.03 = mg/milliequivalents for ammonium ion
- 22.4 = liters of ideal gas per lb-mol of substance at 0^oC and 1 atm (ref. Civil Engineering Reference Manual, 7th ed. - Michael R. Lindeburg)
- 24.04 = liters of ideal gas per lb-mol of substance at 20^oC and 1 atm (ref. Civil Engineering Reference Manual, 7th ed. - Michael R. Lindeburg)
- 5.02×10^4 = constant derived from the molecular weight and correcting standard temperature and pressure (ref. Bay Area Air Quality Management District, Source Test Procedure ST-1B, Ammonia Integrated Sampling, Adopted January 20, 1982, Regulation 7-303)

- C_a = Acetone blank concentration, mg/mg
- C_b = Concentration of NH3 ion in the back half of train (breakthrough)
- C_f = Concentration of NH3 ion in the front half of train (main catch)
- C_{fPM10} = Conc. of filterable PM_{10}, gr/dscf
- $C_{fPM2.5}$ = Conc. of filterable $PM_{2.5}$, gr/dscf
- C_k = K Factor Constant, 849.8

Nomenclature

- C_n = nozzle diameter constant, 0.03575
- C_p' = Coefficient for the pitot used in the preliminary traverse, dimensionless
- C_p = Pitot coefficient for the combined cyclone pitot, dimensionless
- C_{cpm} = Concentration of the condensable PM in the stack gas, dry basis, corrected to standard conditions, milligrams/dry standard cubic foot.
- C_r = Re-estimated Cunningham correction factor for particle diameter equivalent to the actual cut size diameter and calculated using the actual stack gas temperature, dimensionless
- D_{50} = Particle cut diameter, micrometers
- $D_{50(N+1)}$ = D_{50} value for cyclone IV calculated during the N+1 iterative step, micrometers
- D_{50-1} = Re-calculated particle cut diameters based on re-estimated C_r, micrometers
- D_{50LL} = Cut diameter for cyclone I corresponding to the 2.25 micrometer cut diameter for cyclone IV, micrometer
- D_{50N} = D_{50} value for cyclone IV calculated during the Nth iterative step, micrometers
- D_{50T} = Cyclone I cut diameter corresponding to the middle of the overlap zone shown in Method 201A, Figure 10 of Section 17, micrometers
- D_e = equivalent stack diameter (in.)
- ΔH@ = ΔH @ 0.75 scfm (in. H2O)
- ΔH_{avg} = average orifice pressure (in. H_2O)
- D_n = Inner diameter of sampling nozzle mounted on Cyclone I, inches
- D_{na} = actual nozzle diameter (in.)
- D_p = Physical particle size, micrometers
- Δp = velocity head (in. H_2O)
- Δp_1 = velocity head at first current traverse point (in. H_2O)
- $\Delta p'_1$ = velocity head at first preliminary traverse point (in. H_2O)
- Δp_{avg} = average pitot tube differential pressure (in. H_2O)
- Δp_n = velocity head at subsequent current traverse point (in. H_2O)
- Δp_{RM2} = method 2 velocity head (in. H_2O)
- D_s = diameter of stack (in.)
- F_d = fuel f-factor (dscf/MMBtu)
- f_{O2} = stack gas fraction of O_2, by volume, dry basis
- I = Percent isokinetic sampling, dimensionless
- K_1 = standard volume correction, 17.65^{o}R/in. Hg
- K_4 = isokinetic conversion constant, 0.0945min•in.Hg/sec•^{o}R
- K_5 = water mass to std water vapor, 0.04715 ft^3/g
- K_p = 85.49, ((ft/sec)/(pounds/mole -^{o}R))
- L = length of stack (in.)
- L_{fw} = distance to far wall of stack (in.)
- L_{nw} = distance to near wall of stack (in.) [reference]
- $m_{\#x}$ = weight measurements (g)
- M_1 = Milligrams of PM collected on the filter, less than or equal to 2.5 micrometers
- M_2 = Milligrams of PM recovered from Container #2 (acetone blank corrected), greater than 10 micrometers
- M_3 = Milligrams of PM recovered from Container #3 (acetone blank corrected), less than or equal to 10 and greater than 2.5 micrometers
- M_4 = Milligrams of PM recovered from Container #4 (acetone blank corrected), less than or equal to 2.5 micrometers

Nomenclature

- m_a = Mass of residue of acetone after evaporation, mg
- m_c = Mass of the NH4+ added to sample to form ammonium sulfate, mg
- m_{cpm} = Mass of the total condensable PM, mg
- M_d = Molecular weight of dry gas, pounds/pound mole
- m_{fb} = Mass of total CPM in field train recovery blank, mg
- m_{fx} = final weight, avg of last two measurements (g)
- mg = Milligram
- mg/L = Milligram per liter
- m_i = Mass of inorganic CPM, mg

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{nw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D\,(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s\,(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12\text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D\,(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 3a) [Values from Run 1 test]

Carbon Monoxide Concentration (%)

$$\%CO = \frac{ppmCO}{10{,}000}$$

$$\%CO\ (\%) = \frac{0.00 \quad ppm}{10{,}000\ ppm/\%} = 0.0000\ \%$$

Nitrogen Concentration (%)

$$\%N_2 = 100 - \%CO_2 - \%O_2 - \%CO$$

$\%N_2$ (%) = 100 - 4.90 % - 12.70 % - 0.00 / 10,000 % = 82.4 %

Stack Dry Molecular Weight (lb/lb-mole)

$$M_d\,(lb/lb-mol) = \sum\left(\frac{MW_{comp}}{100} \times \%component\right)$$

M_d (lb/lb-mol) = ($\frac{44 \text{ lb/lb-mol}}{100}$ x 4.90 %) +

($\frac{32 \text{ lb/lb-mol}}{100}$ x 12.70 %) + ($\frac{28 \text{ lb/lb-mol}}{100}$ x [$\frac{0.00}{10{,}000}$ + 82.40]) = $\frac{29.29 \text{ lb}}{\text{lb-mol}}$

Stack Wet Molecular Weight (lb/lb-mole)

$$M_S\,(lb/lb-mol) = \left[M_d \times \left(1 - \frac{B_{WS}}{100}\right)\right] + \left[MW_{H_2O} \times \frac{B_{WS}}{100}\right]$$

M_S (lb/lb-mol) = { $\frac{29.29 \text{ lb}}{\text{lb-mol}}$ x (1 - $\frac{8.39 \%}{100}$) } + { $\frac{18 \text{ lb}}{\text{lb-mol}}$ x $\frac{8.39 \%}{100}$ } = $\frac{28.35 \text{ lb}}{\text{lb-mol}}$

Average Calculated Fuel Factor (F_o)

$$F_{o(avg)} = \frac{\left[20.9 - (\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}{(\%CO_2)_{avg} + (\%CO)_{avg}}$$

$F_{o(avg)}$ = $\frac{20.9\% - 12.70\ \% - (0.5 \text{ x } 0.000\ \%)}{4.90\ \% + 0.000\ \%}$ = 1.673

Average Excess Air (%)

$$\%EA_{avg}\,(\%) = \frac{100 \times \left[(\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}{(0.264 \times (N_2)_{avg}) - \left[(\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}$$

$(\%EA)_{AVG}$ = $\frac{100 \text{ x } \{ \ 12.70\ \% - (0.5 \text{ x } 0.000\ \%) \}}{(\ 0.264 \text{ x } 82.40\ \%) - \{\ 12.70\ \% - (0.5 \text{ x } 0.000\ \%)\}}$ = 140.28 %

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

Cumulative Percent Isokinetic (%) (weighted average of all points)

$$I(\%) = \sum_{1-n} \frac{\left[I(\%) \times V_{m(std)}\right]_{1-n}}{V_{m(std)_{1-n}}}$$

Using Method 5, Eq 5-8 to determine intermediate isokinetics at each point, weighted averaging of the cumulative isokinetics is necessary since all points are not equal, and determined by using the dry standard meter volume collected at each point to weight the cumulative average. Intermediate isokinetics and dry standard meter volumes are found at each point. At each point the cumulative sum is found of each value and the quotient of the two used to determine the cumulative isokinetics for each residual point (n).

EXAMPLE CALCULATIONS (Isokinetic Sampling) [Values from Run 1 test]

Cumulative Percent Isokinetic (%) (weighted average of all points)

$$I(\%) = \sum_{1-n} \frac{\lfloor I(\%) \times V_{m(std)} \rfloor_{1-n}}{V_{m(std)_{1-n}}}$$

Using Method 5, Eq 5-8 to determine intermediate isokinetics at each point, weighted averaging of the cumulative isokinetics is necessary since all points are not equal, and determined by using the dry standard meter volume collected at each point to weight the cumulative average. Intermediate isokinetics and dry standard meter volumes are found at each point. At each point the cumulative sum is found of each value and the quotient of the two used to determine the cumulative isokinetics for each residual point (n).

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{nw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D\,(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s\,(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12\text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

EXAMPLE CALCULATIONS (Reference Method 4) [Values from Run 1 test]

Water Volume Weighed (scf)

$$V_{wsg\ (std)}(scf) = W_t \times K_5$$

$V_{wsg(std)}$ = 65.20 g x 0.04715 ft^3/g = 3.074 scf

Standard Meter Volume (dscf)

$$V_{m(std)}(dscf) = \frac{K_1 \times Y \times V_m \times \left(P_b + \frac{\Delta H_{avg}}{13.6}\right)}{(t_m)_{avg} + T_u}$$

$$V_{m(std)} = \frac{\frac{17.65\ ^\circ R}{in.\ Hg} \times 0.99 \times 40.96\ dcf \times \left(30.09\ in.\ Hg + \frac{0.34\ in.\ H_2O}{13.6\ in.\ H_2O / in.\ Hg}\right)}{83.10\ ^\circ F + 460\ ^\circ R} = 39.48\ dscf$$

Calculated Moisture Content (%)

$$B_{ws(calc)}(\%) = 100 \times \frac{V_{wsg(std)}}{V_{wsg(std)} + V_{m(std)}}$$

$$B_{ws(calc)} = 100 \times \frac{3.07\ dscf}{3.07\ dscf + 39.48\ dscf} = 7.22\ \%$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Analysis) [Values from Run 1 test - H_2SO_4 (IC)]

Stack H_2SO_4 Mass (mg)

$$M_n(mg) = \frac{M_{n(lab)}}{V_{s(lab)}} \times V_{sample} \times \frac{L}{1000ml}$$

M_n (mg) = $\frac{\text{L}}{\text{1000 ml}}$ x 0.18 $\frac{\text{mg}}{\text{L}}$ x 154.00 ml = 0.03 mg

Stack H_2SO_4 Concentration (g/dscf)

$$c_s(g/dscf) = 0.001 \times \frac{M_n}{V_{m(std)}}$$

c_s (g/dscf) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{0.03 mg}}{\text{39.48 dscf}}$ = $\frac{\text{6.80E-07 g}}{\text{dscf}}$

Stack H_2SO_4 Concentration (gr/dscf)

$$c'_s(gr/dscf) = 0.001 \times \frac{M_n}{V_{m(std)}} \times \frac{7000}{453.592}$$

c'$_s$ (gr/dscf) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{0.03 mg}}{\text{39.48 dscf}}$ x $\frac{\text{7000 gr}}{\text{lb}}$ x $\frac{\text{lb}}{\text{453.592 g}}$ = $\frac{\text{1.06E-05 gr}}{\text{dscf}}$

Stack H_2SO_4 Concentration (g/L)

$$c''_s(g/L) = c'_s \times \frac{dscf}{28.31685 dsL}$$

c'$_s$ (gr/dscf) = 6.84E-07 $\frac{\text{g}}{\text{dscf}}$ x $\frac{\text{dscf}}{\text{28.31685 dsL}}$ = $\frac{\text{2.00E-08 g}}{\text{L}}$

Stack H_2SO_4 Concentration (ppmvd)

$$c'''_s(ppmvd) = \frac{M_n}{V_{m(std)}} \times Ideal\ Gas\ Constant \times \frac{10^6 parts}{million\ parts} \times \frac{1}{Mol\ Wt}$$

c'''$_s$ (ppmvd) = 2.42E-08 $\frac{\text{g}}{\text{L}}$ x $\frac{\text{24.04 L gas}}{\text{lb-mol}}$ x $\frac{10^6 \text{ parts}}{\text{MM parts}}$ x $\frac{\text{lb-mol}}{\text{98.0790 lb}}$ = 0.006 ppmvd

H_2SO_4 Emissions Rate (lb/MMBtu)

Oxygen Based:

$$E'''(lb/MMBtu) = \frac{M_n \times F_d}{V_{m(std)} \times 1000 \times 453.592} \times \left(\frac{20.9}{20.9 - \%O_2}\right)$$

E''' (lb/MMBtu) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{lb}}{\text{453.592 g}}$ x $\frac{\text{0.03 mg}}{\text{39.48 dscf}}$ x $\frac{\text{8,636.30 dscf}}{\text{MMBtu}}$ x ($\frac{\text{20.9}}{\text{20.9 - 11.7 \%}}$) = $\frac{\text{0.00003 lb}}{\text{MMBtu}}$

40 CFR 60, Method 2G, Section 8.11.1 (but applies to all Method 2 type static pressure measurements):
If a Type S probe is used for this measurement, position the probe at or between any traverse point(s) and rotate the probe until a null differential pressure reading is obtained. Disconnect the tubing from one of the pressure ports; read and record the ΔP. For pressure devices with one-directional scales, if a deflection in the positive direction is noted with the negative side disconnected, then the static pressure is positive. Likewise, if a deflection in the positive direction is noted with the positive side disconnected, then the static pressure is negative.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Source Information	
Plant Name	Cricket Valley Energy Center
Sampling Location	U-00002 Base+DB
Fuel Type	Gas, Natural

Test Information			
Project #		bec-19-cricketvalley.ny-start#2	
Operator		Rob White	
Date for Preliminary Run	(mm/dd/yy)	03/10/20	
Standard Temperature		68	°F
Standard Pressure		29.92	in Hg
Required Sample Vol.	indust. spec.	50	scf
Run Duration	chk Subpart	240	minutes
Unit Number		U-00002	
Base Run Number		PM U-00002 Base+DB	
Number of Ports Available		4	
Number of Ports Used		4	
Port Inside Diameter		6.00	in
Stack Shape		Circular

40 CFR 60, Method 2G, Section 8.11.1 (but applies to all Method 2 type static pressure measurements):
If a Type S probe is used for this measurement, position the probe at or between any traverse point(s) and rotate the probe until a null differential pressure reading is obtained. Disconnect the tubing from one of the pressure ports; read and record the ΔP. For pressure devices with one-directional scales, if a deflection in the positive direction is noted with the negative side disconnected, then the static pressure is positive. Likewise, if a deflection in the positive direction is noted with the positive side disconnected, then the static pressure is negative.

Notes:

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Cylinder Number:	EB0072934	**Certification Date:**	05/21/2019
Product ID Number:	121026	**Expiration Date:**	05/19/2027
Cylinder Pressure:	1900 PSIG	**MFG Facility:**	RBTGS-Shreveport-LA
COA #	EB0072934.20190521-0	**Lot Number:**	EB0072934.20190521
Customer PO. NO.:		**Tracking Number:**	084249399
Customer:		**Previous Certification Dates:**	

This mixture is for laboratory use only, not for drug, household or other use.
This mixture is certified in Mole % to be within ±2% of the actual number reported with a confidence of 95%.
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

Composing Material: Zero Ambient Nitrogen, Cert., Sz152

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

APPENDIX D

QUALITY ASSURANCE AND QUALITY CONTROL DATA

QA/QC PROGRAM

AIR HYGIENE ensures the quality and validity of its emission measurement and reporting procedures through a rigorous quality assurance (QA) program. The program is developed and administered by an internal QA team and encompasses six major areas:

1. Field Qualifications
2. QA reviews of reports, laboratory work, and field testing;
3. Equipment calibration and maintenance;
4. Chain-of-custody;
5. Training; and
6. Knowledge of current test methods

Field Qualifications

Air Hygiene personnel are required to gain and maintain competence with testing methods and techniques according to their job titles and the roles they play during field testing events. Qualifications for each job description include:

Staff Technician - An entry level position with responsibility to test on the stack by performing duties that include: keep trucks and trailers stocked and clean, travel to and from job site, be the “hands of the test” on the stack; stay on a stack during the sample test, set up and tear down equipment on-site, perform maintenance on equipment in the shop and on-site.

Test Technician or Specialist - Acts as the “hands of the test” on the stack by performing duties that include: stay on a stack during the sample test, migrate to the testing trailer and learn the different analyzers and testing methods used on site, set up and tear down testing equipment on site, learn the system for testing from Testing Managers and Project Managers, travel to and from job site; including driving responsibilities under DOT requirements, follow directions of Testing Managers and Project Managers, learn the proper way to conduct on-site test of stationary stacks

Test Manager or Engineer - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Test Managers must hold at least one QSTI certificate.

Project Manager - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Project Managers typically hold QSTI certificates in Groups 1 through 4.

QA Reviews

Air Hygiene’s review procedure includes review of each source test report, along with laboratory and fieldwork, by the QA Team. The most important review is the one that takes place before a test program begins. The QA Team works closely with technical division personnel to prepare and review test protocols. Test protocol review includes selection of appropriate test procedures, evaluation of interferences or other restrictions that might preclude use of standard test procedures, and evaluation and/or development of alternate procedures.

Equipment Calibration and Maintenance

The equipment used to conduct the emission measurements is maintained according to the manufacturer’s instructions to ensure proper operation. In addition to the maintenance program, calibrations are carried out on each measurement device according to the schedule outlined by the Environmental Protection Agency. Quality control checks are also conducted in the field for each test program. In conformance with ASTM D7036 Section 15.3.15, all metering and monitoring equipment meets or exceeds the uncertainty criteria contained in the method language that pertains to that equipment.

Chain-of-Custody

Air Hygiene maintains full chain-of-custody documentation on all samples and data sheets. In addition to normal documentation of changes between field sample custodians, laboratory personnel, and field test personnel, Air Hygiene documents every individual who handles any test component in the field (e.g., probe wash, impinger loading and recovery, filter loading and recovery, etc.). Samples are stored in a locked area to which only Air Hygiene personnel have access. Field data sheets are secured at Air Hygiene's offices upon return from the field.

Training

Personnel's training is essential to ensure quality testing. Air Hygiene has formal and informal training programs, which include:

1. Attendance at EPA-sponsored training courses
2. Enrollment in EPA correspondence courses
3 A requirement for all technicians to read and understand Air Hygiene's QA manual
4. In-house training and QA meetings on a regular basis
5. Maintenance of training records

Knowledge of Current Test Methods

With the constant updating of standard test methods and the wide variety of emerging test procedures, it is essential that any qualified source tester keep abreast of new developments. Air Hygiene subscribes to services, which provide updates on EPA reference methods, rules, and regulations. Additionally, source test personnel regularly attend and present papers at testing and emission-related seminars and conferences. Air Hygiene personnel maintain membership in the Air and Waste Management Association and the American Industrial Hygiene Association.

Reproduction and Distribution Policy

Reproducing portions of this test report may omit critical or substantial documentation or be taken out of context and due care must be exercised in this regard. Furthermore, this test report and its associated data shall not be reproduced in full or in part without the written consent of the customer.

Data Provided by Client

Data provided by the Client is clearly identified in the report. Air Hygiene accepts data provided by the Client as accurate.

COMBUSTION TESTING QUALITY ASSURANCE ACTIVITIES

In conformance with ASTM D7036 Section 15.3.11 and 13, all testing was performed without any real or apparent errors, with the exception of those that would be listed in Section 2.0 of this report. In addition, all testing was conducted according to the approved testing protocol, test methods, Air Hygiene Quality Manual, or ASTM D7036, with the exception of specifics noted in Section 2.0 of this report. A number of quality assurance activities were undertaken before, during, and after this testing project. This section of the report combined with the documentation in Appendix C describes each of those activities.

Each instrument's response was checked and adjusted in the field prior to the collection of data via multi-point calibration. The instrument's linearity was checked by adjusting its zero and span responses to zero nitrogen and an upscale calibration gas in the range of the expected concentrations. The instrument response was then challenged with other calibration gases of known concentration and accepted as being linear if the response of the other calibration gases agreed within plus or minus two percent of the range of predicted values. NO_2 to NO conversion was checked via direct connect with an EPA Protocol certified concentration of NO_2 in a balance of air or nitrogen. Conversion was verified to be between 90 and 110 percent.

After each test run, the analyzers were checked for zero and span drift. This allowed each test run to be bracketed by calibrations and documents the precision of the data just collected. The criterion for acceptable data is that the instrument drift is no more than three percent of the full-scale response. The quality assurance worksheets in the following pages summarize all multipoint calibration checks and zero to span checks performed during the tests. These worksheets (as prepared from the data records of Appendix A) show that no drifts in excess of three percent occurred in the zero to span checks following each test run.

The sampling systems were leak checked by demonstrating that a vacuum greater than 10 in Hg could be held for at least one minute with a decline of less than one inch of Hg. A leak test was conducted after the sample system was set up and before the system was dismantled. This test was conducted to ensure that ambient air had not diluted the sample. Any leakage detected prior to the tests would be repaired and another leak check conducted before testing commenced. No leaks were found during the pre or post-test leak checks.

The absence of leaks in the sampling system was also verified by a sampling system bias check. The sampling system's integrity was tested by comparing the responses of the analyzers to the calibration gases introduced via two paths. The first path was directly into the analyzer and the second path via the sample system at the sample probe. Any difference in the instrument responses by these two methods was attributed to sampling system bias or leakage. The criterion for acceptance is agreement within five percent of the span of the analyzer.

The control gases used to calibrate the instruments were analyzed and certified by the compressed gas vendors to plus or minus one percent accuracy for all gases. EPA Protocol No. 1 was used, where applicable to assign the concentration values traceable to the National Institute of Standards and Technology (NIST), Standard Reference Materials (SRM's). The gas calibration sheets as prepared by the vendor are contained in Appendix C.

Air Hygiene collected and reported the enclosed test data in accordance with the procedures and quality assurance activities described in this test report. Air Hygiene makes no warranty as to the suitability of the test methods. Air Hygiene also assumes no liability relating to the interpretation and use of the test data.

NOx Converter Efficiency

Date: March 10, 2020

Analyzer: inst-nx-0020

RM 7E, (02-27-14), Sections 7.1.4; 8.2.4.1; 12.7; and 13.5 Introduce NO_2 to the analyzer and record the NOx concentration displayed. ... Calculate the converter efficiency using Equation 7E-7. The specification for converter efficiency must be met. ... Air Hygiene also references ALT-0013 for specific NO_2 concentration (40-60 ppm) and EPA Traceability Protocol requirements (±2%).

Audit Gas:	NO_2 Concentration (C_v), ppmvd	**48.70**
Converter Efficiency Calculations:		
	Analyzer Reading, NO Channel, ppmvd	**1.13**
	Analyzer Reading, NOx Channel, ppmvd	**49.17**
	Analyzer Reading, NO_2 Channel ($C_{Dir(NO2)}$), ppmvd	**48.04**
	Converter Efficiency, %	**98.64**

RM 7E, (02-27-14), 13.5 NO_2 to NO Conversion Efficiency Test (as applicable). The NO_2 to NO conversion efficiency, calculated according to Equation 7E-7, must be greater than or equal to 90 percent.

$$Eff_{NO2} = \left(\frac{C_{Dir}}{C_V}\right) \times 100$$

Eq. 7E-7 = $\frac{48.04 \text{ ppmvd}}{48.70 \text{ ppmvd}}$ x 100 = 98.64%

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

GENERAL COMMENTS

Sample MFT282 [M202- U2 BASE W/DB- R1] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MFT283 [M202- U2 BASE W/DB- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MFT284 [M202- U2 BASE W/DB- R3] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MFT285 [M202- U2 BASE- R1] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MFT286 [M202- U2 BASE- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MFT287 [M202- U2 BASE- R3] : ORGANIC EXTRACTION : Oily material found in vial.

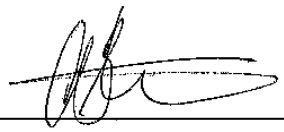
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.



NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

GENERAL COMMENTS

Sample MBP535 [M8A/M202- DI WATER BLANK] : INORGANIC EXTRACTION: No residue noted in Teflon dish.

Sample MBP536 [M202- HEXANE BLANK] : ORGANIC EXTRACTION: No residue noted in vial.

Sample MBP537 [M202- ACETONE BLANK] : ORGANIC EXTRACTION: No residue noted in vial.

Sample MBP538 [M202- FB] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP539 [M202- W/DB- R1] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP540 [M202- W/DB- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP541 [M202- W/DB- R3] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP543 [M202- W/ODB- R1] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP544 [M202- W/ODB- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP545 [M202- W/ODB- R3] : ORGANIC EXTRACTION : Light oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Results relate only to the items tested.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

For Orifice Calibration Factor dH@, the orifice differential pressure in inches of H_20 that equates to 0.75 cfm of air at 68 °F and 29.92 inches of Hg, acceptable tolerance of individual values from the average is +/- 0.2. For valid test results, the Actual Vacuum should be 1 to 2 in. Hg greater than the Theoretical Critical Vacuum shown above. The Critical Orifice Coefficient, K', must be entered in English units, (ft)^3*(deg R)^0.5/((in.Hg)*(min)).

Standard for Calibration of Console Thermocouple Systems

40 CFR, Part 60
Appendix A, Method 5
10.3.2 The temperature data recorded in the field shall be considered valid. If, during calibration, the absolute temperature measured with the sensor being calibrated and the reference sensor **agree within 1.5 percent**, the temperature data taken in the field shall be considered valid.

Standard for Calibration of Individual Thermocouples

EMC, ALT-011: After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer (either ASTM reference thermometer or a thermometer that has been calibrated against an ASTM reference thermometer). The temperatures of the thermocouple and reference thermometers shall **agree to within ±2°F**.

Check the continuity of the thermocouple by subjecting it to a change in the temperature (e.g.., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections (noted by a wrong change in the temperature).

Standard for Calibration of Individual Thermocouples

EMC, ALT-011: After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer (either ASTM reference thermometer or a thermometer that has been calibrated against an ASTM reference thermometer). The temperatures of the thermocouple and reference thermometers shall **agree to within ±2°F**.

Check the continuity of the thermocouple by subjecting it to a change in the temperature (e.g.., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections (noted by a wrong change in the temperature).

Notes:

For Calibration Factor Y, the ratio of the reading of the calibration meter to the dry gas meter,acceptable tolerance of individual values from the average is +/- 0.02. For Orifice Calibration Factor dH@, the orifice differential pressure in inches of H_20 that equates to 0.75 cfm of air at 68 °F and 29.92 inches of Hg, acceptable tolerance of individual values from the average is +/- 0.2. For valid test results, the Actual Vacuum should be 1 to 2 in. Hg greater than the Theoretical Critical Vacuum shown above. The Critical Orifice Coefficient, K', must be entered in English units, (ft)^3*(deg R)^0.5/((in.Hg)*(min)).

Emissions Compliance Test
General Electric, 7F.05, Unit #U-00003
Cricket Valley Energy Center LLC
Cricket Valley Energy Center
Dover Plains, New York
April 15-17, 2020

1.0 INTRODUCTION

Air Hygiene International, Inc. (Air Hygiene) has completed the Emissions Compliance Test for nitrogen oxides (NOx), carbon monoxide (CO), total hydrocarbons/volatile organic compounds (THC/VOC), sulfur dioxide (SO_2) [by fuel analysis], ammonia (NH_3), particulate matter (PM_{10}), sulfuric acid mist (SAM), opacity / visual emissions (VE), flow, moisture (H_2O), carbon dioxide (CO_2), and oxygen (O_2) from the exhaust of the General Electric, 7F.05, Unit #U-00003 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. This report details the background, results, process description, and the sampling/analysis methodology of the stack sampling survey conducted on April 15-17, 2020.

1.1 TEST PURPOSE AND OBJECTIVES

The purpose of the test was to conduct an initial compliance emission test to document levels of selected pollutants at two test loads, base loaded with duct burners on and base loaded with duct burners off (Base+DB and Base). The information will be used to confirm compliance with the operating permit issued by the New York State Department of Environmental Conservation (NYSDEC). The specific objective was to determine the emission concentrations and rates of NOx, CO, THC/VOC, SO_2 [fuel analysis], NH_3, PM_{10}, SAM, VE, flow, H_2O, CO_2, and O_2 from the exhaust of Cricket Valley Energy Center LLC's General Electric, 7F.05, Unit #U-00003 at Base+DB and Base.

1.2 SUMMARY OF TEST PROGRAM

The following list details pertinent information related to this specific project:

1.2.1 Participating Organizations
- New York State Department of Environmental Conservation (NYSDEC)
- Cricket Valley Energy Center LLC
- Bechtel Corporation
- Air Hygiene

1.2.2 Industry
- Electric Utility / Electric Services

1.2.3 Air Permit Requirements
- Permit Number: 3-1326-00275/00009

1.2.4 Plant Location
- Cricket Valley Energy Center in Dover Plains, New York
  - GPS Coordinates [Latitude 41.67721, Longitude -73.57992]
  - Physical Address: 2241 ST RTE 22, Dover Plains, New York 12522
  - Federal Registry System / Facility Registry Service (FRS) No. – 110043340364
  - Source Classification Code (SCC) – 10200602

1.2.5 Equipment Tested
- General Electric, 7F.05, Unit #U-00003

1.2.6 Emission Points

- Exhaust from the General Electric, 7F.05, Unit #U-00003
- For all gases, one sample point in the exhaust duct from the General Electric, 7F.05, Unit #U-00003, determined after conducting a 12-point stratification test
- For all PM_{10} testing, 12 sampling points in the exhaust duct from the General Electric, 7F.05, Unit #U-00003
- For all SAM testing, one sample point in the exhaust duct from the General Electric, 7F.05, Unit #U-00003
- For opacity, one sample visual observation point from the exit of the exhaust duct to the atmosphere from the General Electric, 7F.05, Unit #U-00003

1.2.7 Emission Parameters Measured

- NOx
- CO
- THC/VOC
- SO_2 [fuel analysis]

Notes: [1]Air permit specifically indicates design capacity heat input of 2395.7 MMBtu/hr [ISO Conditions, 1 atm (29.923 in Hg), temperature 15 C or 59 F, and RH 60%] for the gas turbine. [2]Air permit specifically indicates design capacity heat input of 247 mmBtu/hr [ISO Conditions, 1 atm (29.923 in Hg), temperature 15 C or 59 F, and RH 60%] for the duct burner.

The results of all measured pollutant emissions were below the required limits. All testing was conducted according to the approved testing protocol. All testing was performed without any real or apparent errors with the following exceptions:

The PM_{10} filter weights were reported by the laboratory at the reportable detection limit (RDL). Supplemental laboratory data was provided and additional data analysis indicated minor filter losses, which were accounted for in either the sample train section cleanup just prior to the filter or the sample train cleanup in the section just after the filter. As a result, the PM results are considered valid with accounting for all minor filter weight losses in other fractions of the sample train results.

The SAM analysis was conducted by titration, per the requirements of CTM-013 with all results reported below the reportable detection limits (RDLs). However, when reporting emission rates using the titration based RDL values, the SAM results exceeded permitted limits. To remedy, the SAM analysis was also conducted by ion chromatography (IC). The supplemental IC analysis (Appendix D) yielded lower RDLs and also all results that were below the permitted limits. Emission rates were calculated based on the supplemental IC data.

The fuel sample collected by Air Hygiene on April 15, 2020 demonstrated a substantial level of nitrogen indicative of contamination from the atmosphere or a leak in the sampling system. A subsequent sample is presented, along with the original, in Appendix E and used for calculations.

3.0 SOURCE OPERATION

3.1 PROCESS DESCRIPTION

Cricket Valley Energy Center LLC owns and operates the Cricket Valley Energy Center located at 2241 ST RTE 22 in Dover Plains, New York. Located on the Cricket Valley Energy Center are three General Electric 7F.05 Combustion Turbine Generators (CTGs), designated as Emission Units U-00001, U-00002, and U-00003. The CTGs and associated heat recovery steam generators (HRSGs) which are equipped with dry low NOx burners in combination with selective catalytic reduction systems (SCRs). The CTG-HRSGs are also equipped with oxidation catalysts which reduce CO and VOC emissions.

3.2 SAMPLING LOCATION

The sample ports were located approximately vertical, circular and measures 19 feet (ft) (228 inches) in diameter at the test ports which are approximately 265.8 ft above grade level with an exit elevation of approximately 282.5 ft above grade level. The test ports are located approximately 70.8 ft (850 inches) downstream and approximately 16.7 ft (200.4 inches) upstream from the nearest disturbances. Air Hygiene has field verified the measurable dimensions. Non-field verified dimensions are provided by Cricket Valley Energy Center LLC. All exhaust samples for gaseous emissions were continuously drawn from the exhaust system at the sample ports from a single point determined after conducting a stratification test. During the stratification test three points were traversed from each of the four ports. The probe was allowed to remain at a point for two times the system response time. For PM_{10} testing, an initial velocity traverse was performed across the stack from 12 total points at each test load. All PM_{10} sampling occurred from the same 12 points. All SAM testing occurred from a simple sample point. All opacity observations were made by viewing the point where the exhaust system exited to the atmosphere at the top of the exhaust stack.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

4.1 TEST METHODS

The emission test on the General Electric, 7F.05, Unit #U-00003 at the Cricket Valley Energy Center was performed following United States Environmental Protection Agency (EPA) methods described by the Code of Federal Regulations (CFR). Table 4.1 outlines the specific methods performed on April 15-17, 2020.

4.2 INSTRUMENT CONFIGURATION AND OPERATIONS FOR GAS ANALYSIS

The sampling and analysis procedures used during these tests conform with the methods outlined in the Code of Federal Regulations (CFR), Title 40, Part 60, Appendix A, Methods 1, 2, 3A, 4, 7E, 9, 10, 18, 19, 25A; 40 CFR 51, Appendix M, Methods 201A and 202; 40 CFR 63, Appendix A, Method 320; Conditional Test Method (CTM)-013 [Method 8A]; ASTM 5504; and GPA 2261.

Figure 4.1 depicts the sample system used for the real-time gas analyzer tests. The gas sample was continuously pulled through the probe and transported, via heat-traced Teflon® tubing, to a heated head pump and into the FTIR then to a stainless-steel minimum-contact condenser designed to dry the sample. Transportation of the sample, through Teflon® tubing, continued into the sample manifold within the mobile laboratory via a stainless steel/Teflon® diaphragm pump. From the manifold, the sample was partitioned to the real-time analyzers through rotameters that controlled the flow rate of the sample. Exhaust samples were routed to the wet based analyzer prior to gas conditioning.

Figure 4.1 shows that the sample system was also equipped with a separate path through which a calibration gas could be delivered to the probe and back through the entire sampling system. This allowed for convenient performance of system bias checks as required by the testing methods.

All instruments were housed in a climate controlled, trailer-mounted mobile laboratory. Gaseous calibration standards were provided in aluminum cylinders with the concentrations certified by the vendor. EPA Protocol No. 1 was used to determine the cylinder concentrations where applicable (i.e. NOx calibration gases).

Table 4.2 provides a description of the analyzers used for the instrument portion of the tests. All data from the continuous monitoring instruments were recorded on a Logic Beach Portable Data Logging System which retrieves calibrated electronic data from each instrument every one second and reports an average of the collected data every 30 seconds. For target compounds measured with the Fourier transform infrared (FTIR) spectrometer,

interferograms consisting of 27 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations. Spectral data was analyzed by the MKS MG2000 software.

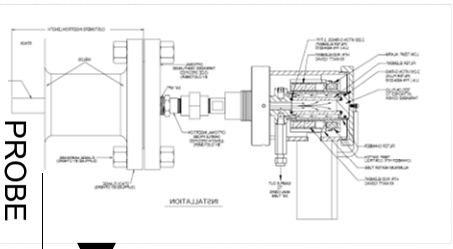
Figure 4.2 represents the sample system used for the PM_{10} tests. A heated stainless-steel probe with a glass liner and stainless-steel nozzle was inserted into the sample ports of the stack to extract gas measurements from the emission stream through a filter and glass impinger train. Flow rates are monitored with oil filled manometers and total sample volumes are measured with a dry gas meter. Glassware that is used to collect and analyze Method 202 condensable particulate samples is cleaned prior to the test with soap and water, and rinsed using tap water, deionized water, acetone, and finally, hexane. After cleaning, Air Hygiene incorporates a glassware bake at 300ºC for six hours rather than the alternative of collecting a field train proof blank.

Figure 4.3 represents the sample system used for the SAM tests. A heated stainless-steel probe with a glass liner was inserted into a sample port of the stack to extract gas measurements from the emission stream through a filter and glass impinger train. Flow rates are monitored with oil filled manometers and total sample volumes are measured with a dry gas meter.

The stack gas analysis for O_2 and CO_2 concentrations was performed in accordance with procedures set forth in EPA Method 3A. The O_2 analyzer uses a paramagnetic cell detector and the CO_2 analyzer uses a continuous nondispersive infrared analyzer.

EPA Method 7E was used to determine concentrations of NOx. A chemiluminescent analyzer was used to determine the nitrogen oxides concentration in the gas stream. A NO_2 in nitrogen certified gas cylinder was used to verify at least a 90 percent NO_2 conversion on the day of the test.

CO emission concentrations were quantified in accordance with procedures set forth in EPA Method 10. A continuous nondispersive infrared (NDIR) analyzer was used for this purpose.



THC emission concentrations were quantified in accordance with procedures set forth in EPA Method 25A. A continuous flame ionization (FID) analyzer was used for this purpose. THC emissions concentrations were below VOC limits and all assumed as VOCs. EPA Method 18 for Tedlar bag sampling and analysis of methane and ethane content was not analyzed or subtracted from the THC concentrations to determine VOC concentrations.

An MKS Instruments - MultiGas™ Fourier Transform Infrared (FTIR) spectrometer, or equivalent, was used for NH_3 analysis per EPA Method 320. The FTIR spectrometer spectral resolution was 0.5 cm^{-1}. The system employed a silicon carbide infrared source at 1200ºC, a helium neon reference laser, beam splitters, potassium bromide (KBr) cell window, front-surface optical transfer mirrors, and multi-pass absorption cells. MCT detectors were used and cooled with liquid nitrogen in order to maintain a constant temperature of 77 Kelvin. The approximately 5.11-meter multi-pass path cells incorporated aspheric, aberration-correcting mirrors to increase the optical throughput and the detection sensitivity. Transducers and thermocouples were connected directly to the insulated sample cells that provide the pressure and temperatures of the sample streams. During testing, the temperature of the absorption cells was set at 191ºC. Elevated temperature prevented gas condensation within the cell and minimized compound adhesion to the cell walls and mirrors. The volume of the absorption cell was 0.5 liters, so at a sample gas flow rate of 10.0 liters per minute, the sample gas in the cell is refreshed at least five times each minute. Interferograms consisting of 27 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations.

Calculations, Formulas, and Constants

The following information supports the spreadsheets for this testing project.

Given Data:

Ideal Gas Conversion Factor = 385.23 SCF/lb-mol at 68 deg F & 14.696 psia

Fuel Heating Value is based upon Air Hygiene's fuel gas calculation sheet. All calculations are based upon a correction to 68 deg F & 14.696 psia

High Heating Values (HHV) are used for the Fuel Heating Value, F-Factor, and Fuel Flow Data per EPA requirements.

Formulas:

1. Corrected Raw Average (C_{Gas}), 40CFR60, App. A, RM 7E, Eq. 7E-5 (08/15/06)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$

2. Correction to % O_2, 40CFR60, App. A, RM 20, Eq. 20-5 (11/26/02)

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$

3. Correction to % O_2 and ISO Conditions

$$C_{ISO} = C_{Adj} \times \sqrt{\frac{P_r}{P_o}} \times e^{(19 \times (H_O - 0.00633))} \times \left(\frac{288}{T_a}\right)^{1.53}$$

4. Method 19 stack exhaust flow (scfh) [ref. EPA EMC FAQ Method 19]

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000}\right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}}\right)$$

5. Emission Rate in lb/hr

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

6. Emission Rate in tons per year

$$E_{ton/yr} = \frac{E_{lb/hr} \times hr_{year}}{2000}$$

7. Emission Concentration in lb/MMBtu (O_2 based)

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$

8. Emission Concentration in g/hp*hr

$$E_{g/hp \cdot hr} = \frac{E_{lb/hr} \times 453.6}{mw \times 1341.022} \; or \; \frac{E_{lb/hr} \times 453.6}{hp}$$

RM 7E, (08-15-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

ACE = Analyzer calibration error, percent of calibration span.
B_{WS} = Moisture content of sample gas as measured by Method 4 or other approved method, percent/100.
C_{Avg} = Average unadjusted gas concentration indicated by data recorder for the test run.
C_D = Pollutant concentration adjusted to dry conditions.
C_{Dir} = Measured concentration of a calibration gas (low, mid, or high) when introduced in direct calibration mode.
C_{Gas} = Average effluent gas concentration adjusted for bias.
C_M = Average of initial and final system calibration bias (or 2-point system calibration error) check responses for the upscale calibration gas.
C_{MA} = Actual concentration of the upscale calibration gas, ppmv.
C_O = Average of the initial and final system calibration bias (or 2-point system calibration error) check responses from the low-level (or zero) calibration gas.
C_S = Measured concentration of a calibration gas (low, mid, or high) when introduced in system calibration mode.
C_{SS} = Concentration of NOx measured in the spiked sample.
C_{Spike} = Concentration of NOx in the undiluted spike gas.
C_{Calc} = Calculated concentration of NOx in the spike gas diluted in the sample.
C_V = Manufacturer certified concentration of a calibration gas (low, mid, or high).
C_W = Pollutant concentration measured under moist sample conditions, wet basis.
CS = Calibration span.
D = Drift assessment, percent of calibration span.
E_p = The predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response.
Eff_{NO2} = NO_2 to NO converter efficiency, percent.
H = High calibration gas, designator.
L = Low calibration gas, designator.
M = Mid calibration gas, designator.
NOFinal = The average NO concentration observed with the analyzer in the NO mode during the converter efficiency test in Section 16.2.2.
NOxCorr = The NOx concentration corrected for the converter efficiency.
NOxFinal = The final NOx concentration observed during the converter efficiency test in Section 16.2.2.
NOxPeak = The highest NOx concentration observed during the converter efficiency test in Section 16.2.2.
Q_{Spike} = Flow rate of spike gas introduced in system calibration mode, L/min.
Q_{Total} = Total sample flow rate during the spike test, L/min.
R = Spike recovery, percent.
SB = System bias, percent of calibration span.
SB_i = Pre-run system bias, percent of calibration span.
SB_f = Post-run system bias, percent of calibration span.
SB / D_{Alt} = Alternative absolute difference criteria to pass bias and/or drift checks.
SCE = System calibration error, percent of calibration span.
SCE_i = Pre-run system calibration error, percent of calibration span.
SCE_{final} = Post-run system calibration error, percent of calibration span.
Z = Zero calibration gas, designator.

RM 19, (07-29-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

AdjFactor = Percent oxygen or carbon dioxide adjustment applied to a target pollutant
B_{wa} = Moisture fraction of ambient air, percent.
Btu = British thermal unit
$\%_C$ = Concentration of carbon from an ultimate analysis of fuel, weight percent.
$\%_{CO2d}$,$\%_{CO2w}$ = Concentration of carbon dioxide on a dry and wet basis, respectively, percent.
CIP / CDP = Combustor inlet pressure / compressor discharge pressure (mm Hg); note, some manufactures reference as PCD.
E = Pollutant emission rate, ng/J (lb/million Btu).
E_a = Average pollutant rate for the specified performance test period, ng/J (lb/million Btu).
E_{ao}, E_{ai} = Average pollutant rate of the control device, outlet and inlet, respectively, for the performance test period, ng/J (lb/million Btu).
E_{bi} = Pollutant rate from the steam generating unit, ng/J (lb/million Btu).
E_{bo} = Pollutant emission rate from the steam generating unit, ng/J (lb/million Btu).
E_{ci} = Pollutant rate in combined effluent, ng/J (lb/million Btu).
E_{co} = Pollutant emission rate in combined effluent, ng/J (lb/million Btu).
E_d = Average pollutant rate for each sampling period (e.g.,24-hr Method 6B sample or 24-hr fuel sample) or for each fuel lot (e.g., amount of fuel bunkered), ng/J (lb/million Btu).
E_{di} = Average inlet SO_2 rate for each sampling period d, ng/J (lb/million Btu).
E_g = Pollutant rate from gas turbine, ng/J (lb/million Btu).
E_{ga} = Daily geometric average pollutant rate, ng/J (lbs/million Btu) or ppm corrected to 7 percent O_2.
E_{jo},E_{ji} = Matched pair hourly arithmetic average pollutant rate, outlet and inlet, respectively, ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
E_h = Hourly average pollutant, ng/J (lb/million Btu).
E_{hj} = Hourly arithmetic average pollutant rate for hour "j," ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
EXP = Natural logarithmic base (2.718) raised to the value enclosed by brackets.
Fc = Ratio of the volume of carbon dioxide produced to the gross calorific value of the fuel from Method 19
F_d, F_w, F_c = Volumes of combustion components per unit of heat content, scm/J (scf/million Btu).
ft^3 = cubic feet
G = ideal gas conversion factor
(385.23 SCF/lb-mol at 68 deg F & 14.696 psia)
GCM = gross Btu per SCF (constant, compound based)
GCV = Gross calorific value of the fuel consistent with the ultimate analysis, kJ/kg (Btu/lb).
GCV_p, GCV_r = Gross calorific value for the product and raw fuel lots, respectively, dry basis, kJ/kg (Btu/lb).
$\%_H$ = Concentration of hydrogen from an ultimate analysis of fuel, weight percent.
H_b = Heat input rate to the steam generating unit from fuels fired in the steam generating unit, J/hr (million Btu/hr).
H_g = Heat input rate to gas turbine from all fuels fired in the gas turbine, J/hr (million Btu/hr).
$\%_{H2O}$ = Concentration of water from an ultimate analysis of fuel, weight percent.
H_r = Total numbers of hours in the performance test period (e.g., 720 hours for 30-day performance test period).
K = volume of combustion component per pound of component (constant)
K = Conversion factor, 10^{-5} (kJ/J)/(%) [10^6 Btu/million Btu].

K_{sulfur} = $2x10^4$ Btu/wt%-MMBtu
K_w = (1.30 scm/kg)/% [(0.21 scf/lb)/%].
lb = pound
ln = Natural log of indicated value.
L_p,L_r = Weight of the product and raw fuel lots, respectively, metric ton (ton).
$\%_N$ = Concentration of nitrogen from an ultimate analysis of fuel, weight percent.
$M_{\%}$ = mole percent
mol = mole
MW = molecular weight (lb/lb-mol)
MW_{AIR} = molecular weight of air (28.9625 lb/lb-mole)[1]
NCM = net Btu per SCF (constant based on compound)
$\%_O$ = Concentration of oxygen from an ultimate analysis of fuel, weight percent.
$\%_{O2d}$, $\%_{O2w}$ = Concentration of oxygen on a dry and wet basis, respectively, percent.
P_B = barometric pressure, in Hg
P_s = Potential SO2 emissions, percent.
$\%_S$ = Sulfur content of as-fired fuel lot, dry basis, weight percent.
S_e = Standard deviation of the hourly average pollutant rates for each performance test period, ng/J (lb/million Btu).
$\%_{Sf}$ = Concentration of sulfur from an ultimate analysis of fuel, weight percent.
S(wt%) = weight percent of sulfur, per lab analysis by appropriate ASTM standard
S_i = Standard deviation of the hourly average inlet pollutant rates for each performance test period, ng/J (lb/million Btu).
S_o = Standard deviation of the hourly average emission rates for each performance test period, ng/J (lb/million Btu).
$\%S_p$, $\%S_r$ = Sulfur content of the product and raw fuel lots respectively, dry basis, weight percent.
SCF = standard cubic feet
SH = specific humidity, pounds of water per pound of air
$t_{0.95}$ = Values shown in Table 19-3 for the indicated number of data points n.

EXAMPLE CALCULATIONS (FFACTOR)

RM 19, (02-27-14),
2.0 Summary of Method,
2.1 Emission Rates. Oxygen (O_2) or carbon dioxide (CO_2) concentrations and appropriate F factors (ratios of combustion gas volumes to heat inputs) are used to calculate pollutant emission rates from pollutant concentrations.

RM 19, (02-27-14),
12.2 Emission Rates of PM, SO_2, and NOx. Select from the following sections the applicable procedure to compute the PM, SO_2, or NOx emission rate (E) in lb/MMBtu. The pollutant concentration must be in lb/scf and the F factor must be in scf/MMBtu. If the pollutant concentration (C) is not in the appropriate units, use Table 19–1 in Section 17.0 to make the proper conversion. An F factor is the ratio of the gas volume of the products of combustion to the heat content of the fuel. The dry F factor (F_d) includes all components of combustion less water, the wet F factor (F_w) includes all components of combustion, and the carbon F factor (F_c) includes only carbon dioxide.

EXAMPLE CALCULATIONS (INFORMATION)

Specific Humidity (RH_{sp})

Note: RHsp (gr/lb) calculated using temperature, relative humidity, and barometric pressure with psychrometric chart, psychrometric calculator, or built in psychrometric algorithm.

$$RH_{sp}(lb/lb) = \left[\left(\frac{gr}{lb}\right) \times \frac{lb}{7000\,gr}\right]$$

RH_{sp}= 13.57 gr / lb x 1 lb / 7000 gr = 0.001939 lb H_2O / lb Air

Fuel Flow Conversion (Q_f)

Note: Qf(lb/min) is a value obtained from the source operator.

$$Q_f = \left[Q_f \times G \times \left(\frac{1}{MW_{Fuel}}\right)\right]$$

Q_f = 1,650.71 lb / min x 60 min / hr x 385.23 ft^3 / lb-mol x lb-mol / 16.63 lb = 2,293,723 SCFH

Heat Rate (MMBtu/hr)

$$HR = \frac{HHV_{DRY} \times Q_f}{1{,}000{,}000}$$

Heat Rate = 1,014.41 Btu / SCF x 2,293,723.12 SCF / hr x MMBtu / 10^6 Btu = 2,326.77 MMBtu / hr

RM 25A, (02-27-14), 8.4 Calibration Error Test. Immediately prior to the test series (within 2 hours of the start of the test), introduce zero gas and high-level calibration gas at the calibration valve assembly. Adjust the analyzer output to the appropriate levels, if necessary. Calculate the predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response. Then introduce low-level and mid-level calibration gases successively to the measurement system. ... These differences must be less than 5 percent of the respective calibration gas value. (calc for THC/VOC analyzer mid gas, if applicable)

$$E_P = \frac{C_{Dir(H)} - C_{Dir(Z)}}{C_{V(H)} - C_{V(Z)}} \times C_{Dir(M)} + C_{Dir(Z)}$$

Eq. of a line y=mx+b

E_p = (8.70 ppm - 0.00 ppm) / (8.78 ppm - 0.00 ppm) x 5.19 ppm + 0.00 = 5.14 ppm

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100$$ Eq. 7E-1

ACE_{VOC} = (4.97 ppm - 5.14 ppm) / 5.19 ppm x 100 = -3.33 %

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (BIAS, DRIFT, AND CORRECTED RAW AVERAGE)

System Bias

RM 7E, (02-27-14), 12.3 System Bias. For non-dilution systems, use Equation 7E-2 to calculate the system bias separately for the low-level and upscale calibration gases. (calc for NOx analyzer upscale gas, Run 1 initial bias, if applicable)

$$SB = \left(\frac{C_S - C_{Dir}}{CS}\right) \times 100$$ Eq. 7E-2

SB = $\frac{4.60 \text{ ppm} - 4.85 \text{ ppm}}{8.90 \text{ ppm}}$ x 100 = -2.81 %

Drift Assessment

RM 7E, (02-27-14), 12.5 Drift Assessment. Use Equation 7E-4 to separately calculate the low-level and upscale drift over each test run. (calc for NOx analyzer upscale drift, Run 1, if applicable)

$$D = \left|SB_{final} - SB_i\right|$$ Eq. 7E-4

D = | -2.58 % - -2.81 % | = 0.22 %

Alternative Drift and Bias

RM 7E, (02-27-14), 13.2 / 13.3 System Bias and Drift. Alternatively, the results are acceptable if |Cs – Cdir| is ≤ 0.5 ppmv or if |Cs – Cv| is ≤ 0.5 ppmv (as applicable). (calc for NOx analyzer initial upscale, Run 1, if applicable)

$$SB / D_{Alt} = \left|C_S - C_{Dir}\right|$$ Eq. Section 13.2 and 13.3

SB / D_{Alt} = | 4.60 ppm - 4.85 ppm | = 0.25 ppm

Bias Adjusted Average

RM 7E, (02-27-14), 12.6 Effluent Gas Concentration. For each test run, calculate Cavg, the arithmetic average of all valid NOx concentration values (e.g., 1-minute averages). Then adjust the value of Cavg for bias, using Equation 7E-5b. (calc for NOx analyzer, Run 1, if applicable)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$ Eq. 7E-5b

C_{Gas} = (1.78 ppm - 0.06 ppm) $\left(\frac{4.55 \text{ ppm}}{4.61 \text{ ppm} - 0.06 \text{ ppm}}\right)$ = 1.73 ppm

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RUNS)

Moisture Correction

RM 7E, (02-27-14), 12.10 Moisture Correction. Use Equation 7E-10 if your measurements need to be corrected to a dry basis. (calc for NOx analyzer, Run 1, if applicable) Note: Calculations may not match as Run 1 results are typically also bias adjusted

$$C_D = \frac{C_W}{1 - B_{WS}}$$ Eq. 7E-10

C_D = $\frac{1.57 \text{ ppmvw}}{1 - 0.09}$ = 1.73 ppmvd or inversely, $C_W = C_D \times \left(1 - B_{WS}\right)$

C_W = 1.73 ppmvd x (1 - 0.09) = 1.57 ppmvw

Diluent-Corrected Pollutant Concentration, O_2 Based

RM 20, (11-26-02), 7.3.1 Correction of Pollutant Concentration Using O_2 Concentration. Calculate the O_2 corrected pollutant concentration, as follows: (calc for NOx gas, Run 1, if applicable) [now contained in applicable Subpart]

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$ Eq. 20-4

C_{adj} = 1.73 ppm x $\left(\frac{20.9\% - 15.00\ \%}{20.9\% - 12.88\ \%}\right)$ = 1.27 ppm@15%O_2

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

Nomenclature

- %CO = carbon monoxide concentration (%)
- $\%CO_2$ = carbon dioxide concentration (%)
- $\%N_2$ = nitrogen concentration (%)
- $\%O_2$ = oxygen concentration (%)
- $\%O_{2,wet}$ = Oxygen content of gas stream, % by volume of wet gas. (Note: The oxygen percentage used in Method 201A, Equation 3 is on a wet gas basis. That means that since oxygen is typically measured on a dry gas basis, the measured percent O2 must be multiplied by the quantity (1 - B_{ws}) to convert to the actual volume fraction. Therefore, $\%O_{2,wet} = (1 - B_{ws}) * \%O_{2, dry}$)
- $(\%EA)_{avg}$ = average excess air (%)
- $(F_o)_{avg}$ = average calculated fuel factor
- $[(\Delta p)^{0.5}]_{avg}$ = Average of square roots of the velocity pressures measured during the preliminary traverse, inches W.C.
- μ = Gas viscosity, micropoise
- 12.0 = Constant calculated as 60 percent of 20.5 square inch cross-sectional area of combined cyclone head, square inches
- 17.03 = mg/milliequivalents for ammonium ion
- 22.4 = liters of ideal gas per lb-mol of substance at 0°C and 1 atm (ref. Civil Engineering Reference Manual, 7th ed. - Michael R. Lindeburg)
- 24.04 = liters of ideal gas per lb-mol of substance at 20°C and 1 atm (ref. Civil Engineering Reference Manual, 7th ed. - Michael R. Lindeburg)
- 5.02×10^4 = constant derived from the molecular weight and correcting standard temperature and pressure (ref. Bay Area Air Quality Management District, Source Test Procedure ST-1B, Ammonia Integrated Sampling, Adopted January 20, 1982, Regulation 7-303)

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{mw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12\text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 3a) [Values from Run 1 test]

Carbon Monoxide Concentration (%)

$$\%CO = \frac{ppmCO}{10{,}000}$$

$$\%CO\ (\%) = \frac{0.00 \quad ppm}{10{,}000\ ppm/\%} = 0.0000\ \%$$

Nitrogen Concentration (%)

$$\%N_2 = 100 - \%CO_2 - \%O_2 - \%CO$$

$\%N_2$ (%) = 100 - 4.90 % - 12.70 % - 0.00 / 10,000 % = 82.4 %

Stack Dry Molecular Weight (lb/lb-mole)

EXAMPLE CALCULATIONS (Isokinetic Sampling) [Values from Run 1 test]

Cumulative Percent Isokinetic (%) (weighted average of all points)

$$I(\%) = \sum_{1-n} \frac{\left[I(\%) \times V_{m(std)}\right]_{1-n}}{V_{m(std)_{1-n}}}$$

Using Method 5, Eq 5-8 to determine intermediate isokinetics at each point, weighted averaging of the cumulative isokinetics is necessary since all points are not equal, and determined by using the dry standard meter volume collected at each point to weight the cumulative average. Intermediate isokinetics and dry standard meter volumes are found at each point. At each point the cumulative sum is found of each value and the quotient of the two used to determine the cumulative isokinetics for each residual point (n).

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{nw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D\,(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s\,(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12 \text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D\,(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 4) [Values from Run 1 test]

Water Volume Weighed (scf)

$$V_{wsg\ (std)}(scf) = W_t \times K_5$$

$V_{wsg(std)}$ = 78.00 g x 0.04715 ft^3/g = 3.678 scf

Standard Meter Volume (dscf)
