$$V_{m(std)}(dscf) = \frac{K_1 \times Y \times V_m \times \left(P_b + \frac{\Delta H_{avg}}{13.6}\right)}{(t_m)_{avg} + T_u}$$

$$V_{m(std)} = \frac{\frac{17.65\ ^\circ R}{in.\ Hg} \times 0.97 \times 42.41\ dcf \times \left(29.91\ in.\ Hg + \frac{0.41\ in.\ H_2O}{13.6\ in.\ H_2O / in.\ Hg}\right)}{68.54\ ^\circ F + 460\ ^\circ R} = 41.29\ dscf$$

Calculated Moisture Content (%)

$$B_{ws(calc)}(\%) = 100 \times \frac{V_{wsg(std)}}{V_{wsg(std)} + V_{m(std)}}$$

$$B_{ws(calc)} = 100 \times \frac{3.68\ dscf}{3.68\ dscf + 41.29\ dscf} = 8.18\ \%$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Analysis) [Values from Run 1 test - H_2SO_4 (IC)]

Stack H_2SO_4 Mass (mg)

$$M_n(mg) = \frac{M_{n(lab)}}{V_{s(lab)}} \times V_{sample} \times \frac{L}{1000ml}$$

M_n (mg) = $\frac{\text{L}}{\text{1000 ml}}$ x 0.38 $\frac{\text{mg}}{\text{L}}$ x 125.00 ml = 0.05 mg

Stack H_2SO_4 Concentration (g/dscf)

$$c_s(g/dscf) = 0.001 \times \frac{M_n}{V_{m(std)}}$$

c_s (g/dscf) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{0.05 mg}}{\text{41.29 dscf}}$ = $\frac{\text{1.14E-06 g}}{\text{dscf}}$

Stack H_2SO_4 Concentration (gr/dscf)

$$c'_s(gr/dscf) = 0.001 \times \frac{M_n}{V_{m(std)}} \times \frac{7000}{453.592}$$

c'$_s$ (gr/dscf) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{0.05 mg}}{\text{41.29 dscf}}$ x $\frac{\text{7000 gr}}{\text{lb}}$ x $\frac{\text{lb}}{\text{453.592 g}}$ = $\frac{\text{1.76E-05 gr}}{\text{dscf}}$

Stack H_2SO_4 Concentration (g/L)

$$c''_s(g/L) = c'_s \times \frac{dscf}{28.31685 dsL}$$

c'$_s$ (gr/dscf) = 1.14E-06 $\frac{\text{g}}{\text{dscf}}$ x $\frac{\text{dscf}}{\text{28.31685 dsL}}$ = $\frac{\text{4.00E-08 g}}{\text{L}}$

Stack H_2SO_4 Concentration (ppmvd)

$$c'''_s(ppmvd) = \frac{M_n}{V_{m(std)}} \times Ideal\ Gas\ Constant \times \frac{10^6 parts}{million\ parts} \times \frac{1}{Mol\ Wt}$$

c'''$_s$ (ppmvd) = 4.02E-08 $\frac{\text{g}}{\text{L}}$ x $\frac{\text{24.04 L gas}}{\text{lb-mol}}$ x $\frac{10^6 \text{ parts}}{\text{MM parts}}$ x $\frac{\text{lb-mol}}{\text{98.0790 lb}}$ = 0.010 ppmvd

H_2SO_4 Emissions Rate (lb/MMBtu)

Oxygen Based:

$$E'''(lb/MMBtu) = \frac{M_n \times F_d}{V_{m(std)} \times 1000 \times 453.592} \times \left(\frac{20.9}{20.9 - \%O_2}\right)$$

E''' (lb/MMBtu) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{lb}}{\text{453.592 g}}$ x $\frac{\text{0.05 mg}}{\text{41.29 dscf}}$ x $\frac{\text{8,638.02 dscf}}{\text{MMBtu}}$ x ($\frac{\text{20.9}}{\text{20.9 - 12.9 \%}}$) = $\frac{\text{0.00006 lb}}{\text{MMBtu}}$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{mw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12\text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 3a) [Values from Run 1 test]

Carbon Monoxide Concentration (%)

$$\%CO = \frac{ppmCO}{10{,}000}$$

$$\%CO\ (\%) = \frac{0.00 \quad ppm}{10{,}000\ ppm/\%} = 0.0000\ \%$$

Nitrogen Concentration (%)

$$\%N_2 = 100 - \%CO_2 - \%O_2 - \%CO$$

$\%N_2$ (%) = 100 - 5.13 % - 11.81 % - 0.00 / 10,000 % = 83.06 %

Stack Dry Molecular Weight (lb/lb-mole)

$$M_d\,(lb/lb-mol) = \sum\left(\frac{MW_{comp}}{100} \times \%component\right)$$

$$M_d\ (lb/lb\text{-}mol) = \left(\frac{44\ lb/lb\text{-}mol}{100} \times 5.13\ \%\right) +$$

$$\left(\frac{32\ lb/lb\text{-}mol}{100} \times 11.81\ \%\right) + \left(\frac{28\ lb/lb\text{-}mol}{100} \times \left[\frac{0.00}{10{,}000} + 83.06\ \right]\right) = \frac{29.29\ lb}{lb\text{-}mol}$$

Stack Wet Molecular Weight (lb/lb-mole)

$$M_S\,(lb/lb-mol) = \left[M_d \times \left(1 - \frac{B_{WS}}{100}\right)\right] + \left[MW_{H_2O} \times \frac{B_{WS}}{100}\right]$$

$$M_S\ (lb/lb\text{-}mol) = \left\{\frac{29.29\ lb}{lb\text{-}mol} \times \left(1 - \frac{9.49\ \%}{100}\right)\right\} + \left\{\frac{18\ lb}{lb\text{-}mol} \times \frac{9.49\ \%}{100}\right\} = \frac{28.22\ lb}{lb\text{-}mol}$$

Average Calculated Fuel Factor (F_o)

$$F_{o(avg)} = \frac{\left[20.9 - (\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}{(\%CO_2)_{avg} + (\%CO)_{avg}}$$

$$F_{o(avg)} = \frac{20.9\% - 11.81\ \% - (0.5 \times 0.000\ \%)}{5.13\ \% + 0.000\ \%} = 1.772$$

Average Excess Air (%)

$$\%EA_{avg}\,(\%) = \frac{100 \times \left[(\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}{(0.264 \times (N_2)_{avg}) - \left[(\%O_2)_{avg} - (0.5 \times (\%CO)_{avg})\right]}$$

$$(\%EA)_{AVG} = \frac{100 \times \{\ 11.81\ \% - (0.5 \times 0.000\ \%)\}}{(0.264 \times 83.06\ \%) - \{\ 11.81\ \% - (0.5 \times 0.000\ \%)\}} = 116.72\ \%$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 2) [Values from Run 1 test]

Absolute Stack Pressure (in. Hg)

$$P_S(in.Hg) = P_b + \frac{P_{static}}{13.6}$$

P_s (in. Hg) = 30.05 in. Hg + $\frac{\text{-0.96 in. } H_2O}{\text{13.6 in. } H_2O/\text{in. Hg}}$ = 29.98 in. Hg

Average Stack Gas Velocity (ft/sec)

$$v_s(ft/\sec) = K_p \times C_p \times \left(\sqrt{\Delta p}\right)_{avg} \times \sqrt{\frac{(t_s)_{avg} + T_u}{P_s \times M_s}}$$

v_{sl} (ft/sec) =

$\left(\frac{85.49 \text{ ft (lb/lb-mol)(in. Hg)}}{\text{sec } (^oR)(\text{in. } H_2O)}\right)^{1/2}$ x 0.77 x 1.18 in.$H_2O^{1/2}$ x $\sqrt{\frac{182.33 + 460\ ^oR}{29.98 \text{ in. Hg x } 28.22 \text{ lb/lb-mol}}}$ = $\frac{67.6 \text{ ft}}{\text{sec}}$

Average Stack Dry Standard Flow Rate (dscfh)

$$Q_{sd}(dscfh) = \frac{60 \times 60 \times \left(1 - \frac{B_{ws}}{100}\right) \times v_s \times A_s \times T_{std} \times P_s}{(t_s + T_u) \times P_{std}}$$

Q_{sd} (dscf/hr) = $\frac{3600 \text{ sec}}{\text{hr}}$ x (1 - $\frac{9.49\ \%}{100}$) x $\frac{67.61 \text{ ft}}{\text{sec}}$ x 283.53 ft^2 x $\frac{68.00 + 460\ ^oR}{182.33 + 460\ ^oR}$ x $\frac{29.98 \text{ in. Hg}}{29.92 \text{ in. Hg}}$ = $\frac{51{,}441{,}564.41 \text{ dscf}}{\text{hr}}$

Average Stack Wet Flow Rate (acfm)

$$Q_{aw}(acfm) = 60 \times v_s \times A_s$$

Q_{aw} (acf/min) = $\frac{60 \text{ sec}}{\text{min}}$ x $\frac{67.61 \text{ ft}}{\text{sec}}$ x 283.53 ft^2 = $\frac{1{,}150{,}138.19 \text{ acf}}{\text{min}}$

Average Stack Wet Standard Flow Rate (ascfh)

$$Q_{sw}(ascfh) = \frac{60 \times Q_{aw} \times T_{std} \times P_s}{(t_s + T_u) \times P_{std}}$$

Q_{sw} (ascf/hr) = $\frac{60 \text{ min}}{\text{hr}}$ x $\frac{1{,}150{,}138.19 \text{ acf}}{\text{min}}$ x $\frac{68.00 + 460\ ^oR}{182.33 + 460\ ^oR}$ x $\frac{29.98 \text{ in. Hg}}{29.92 \text{ in. Hg}}$ = $\frac{56{,}837{,}668.40 \text{ ascf}}{\text{hr}}$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 4) [Values from Run 1 test]

Water Volume Weighed (scf)

$$V_{wsg\ (std)}(scf) = W_t \times K_5$$

$V_{wsg(std)}$ = 200.20 g x 0.04715 ft^3/g = 9.439 scf

Standard Meter Volume (dscf)

$$V_{m(std)}(dscf) = \frac{K_1 \times Y \times V_m \times \left(P_b + \frac{\Delta H_{avg}}{13.6}\right)}{(t_m)_{avg} + T_u}$$

$$V_{m(std)} = \frac{17.65\ ^\circ R}{in.\ Hg} \times 0.98 \times 93.65\ dcf \times \frac{\left(30.05\ in.\ Hg + \frac{0.45\ in.\ H_2O}{13.6\ in.\ H_2O / in.\ Hg}\right)}{80.33\ ^\circ F + 460\ ^\circ R} = 89.99\ dscf$$

Calculated Moisture Content (%)

$$B_{ws(calc)}(\%) = 100 \times \frac{V_{wsg(std)}}{V_{wsg(std)} + V_{m(std)}}$$

$$B_{ws(calc)} = 100 \times \frac{9.44\ dscf}{9.44\ dscf + 89.99\ dscf} = 9.49\ \%$$

Saturated Moisture Content (%)

$$B_{ws(svp)}(\%) = 100 \times \frac{10^{\left(6.691 - \frac{3144}{t_{s(avg)} + 390.86}\right)}}{P_b + \frac{P_{static}}{13.6}} \leq 100$$

$$B_{ws(svp)} = 100 \times \frac{10^{\left(6.691 - \frac{3144}{182.33\ ^\circ F + 390.86}\right)}}{30.05\ in.\ Hg + \frac{-0.96\ in.\ H_2O}{13.6\ in.\ H_2O / in.\ Hg}} \leq 100 = 53.59\ \%$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Isokinetic Sampling) [Values from Run 1 test]

Desired Orifice (in. H_2O) (first point)

$$\Delta H_d\,(in.H_2O) = K \times \Delta p$$

ΔH_d (in. H_2O) = x

in. H_2O = in. H_2O

Absolute Meter Pressure (in. Hg)

$$P_m\,(in.Hg) = P_b + \frac{\Delta H\,@}{13.6}$$

P_m (in. Hg) = 30.05 in. Hg + $\frac{1.85 \text{ in. } H_2O}{13.6 \text{ in. } H_2O/\text{in. Hg}}$ = 30.19 in. Hg

Recommended Nozzle Diameter (in.)

$$D_{nt}\,(in.) = \sqrt{\frac{C_{ti} \times Q_{mi} \times P_{mi}}{(t_{mi} + T_{ti}) \times C_p} \times \left(\frac{1 - \frac{B_{wm}}{100}}{1 - \frac{B_{ws}}{100}}\right)} \times \sqrt{(t_s + T_{ti}) \times \left[\frac{M_d \times \left(1 - \frac{B_{ws}}{100}\right) + \left(18 \times \frac{B_{ws}}{100}\right)}{P_s \times \Delta p_{avg}}\right]}$$

D_{ni} (in.) = $\sqrt{\frac{0.03575 \text{ (lb-mole•°R•in. } H_2O)^{1/2}\text{•min•in.}^2}{\text{acf•in. Hg}^{3/4}\text{•lb}^{1/2}} \text{ x } 0.75 \text{ acf x } 30.19 \text{ in. Hg } \left(1 - \frac{0.00\ \%}{100}\right) \text{ x } \left(\frac{1 - \frac{0.00\ \%}{100}}{1 - \frac{9.49\ \%}{100}}\right) \text{ x } \sqrt{\left(80.33\ ^\circ\text{F} + 460^\circ\text{R}\right) \text{x } 0.77 \text{ x } \left(182.33\ ^\circ\text{F} + 460^\circ\text{R}\right) \text{ x } \frac{\frac{29.29 \text{ lb}}{\text{lb-mole}} \text{ x } \left(1 - \frac{9.49\ \%}{100}\right) + \left(\frac{18 \text{ lb}}{\text{lb-mol}} \text{ x } \frac{9.49\ \%}{100}\right)}{29.98 \text{ in. Hg x } 1.18 \text{ in. } H_2O}}}$ = 0.210 in.

ΔP to ΔH Isokinetic Factor

$$K = C_k \times C_p^2 \times \Delta H\,@ \times D_{na}^4 \times \left[\frac{M_d \times \left(1 - \frac{B_{wm}}{100}\right) + \left(18 \times \frac{B_{wm}}{100}\right)}{M_d \times \left(1 - \frac{B_{ws}}{100}\right) + \left(18 \times \frac{B_{ws}}{100}\right)}\right] \times \left(\frac{1 - \frac{B_{ws}}{100}}{1 - \frac{B_{wm}}{100}}\right)^2 \times \left(\frac{t_m + T_u}{ts + T_u}\right) \times \frac{P_s}{P_m}$$

K = $\frac{849.8}{\text{in. } H_2O\text{•in.}^4}$ x 0.77 ^{2} x 1.85 in. H_2O x 0.16 ^{4} x $\left(\frac{1 - \frac{9.49\ \%}{100}}{1 - \frac{0.00\ \%}{100}}\right)^2$ x $\frac{80.33\ ^\circ\text{F} + 460^\circ\text{R}}{182.33\ ^\circ\text{F} + 460^\circ\text{R}}$) x

Hg}}{30.19 \text{ in. Hg}}$ = 0.40

Percent Isokinetic (%) (first point)

$$I\,(\%) = \frac{K_4 \times \left((t_s)_{avg} + T_u\right) \times V_{m(std)}}{\left(\Theta \times (v_{s(l)})_{avg} \times P_s \times \pi \times \left(\frac{D_{na}}{2} \times \frac{1}{12}\right)^2\right) \times \left(1 - \frac{B_{ws}}{100}\right)}$$

I (%) = $\frac{0.0945 \text{ min•in. Hg}}{\text{sec•}^\circ\text{R}}$ x (181.00 °F + 460 °R) x 7.75 dscf

19.75 min x $\frac{65.50 \text{ ft}}{\text{sec}}$ x 29.98 in. Hg x 3.14 x $\left(\frac{0.16 \text{ in.}}{2} \text{ x } \frac{\text{ft.}}{12 \text{ in.}}\right)^2$ x $\left(1 - \frac{9.49\ \%}{100}\right)$ = 99.54 %

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Isokinetic Sampling) [Values from Run 1 test]

Cumulative Percent Isokinetic (%) (weighted average of all points)

$$I(\%) = \sum_{1-n} \frac{\left[I(\%) \times V_{m(std)}\right]_{1-n}}{V_{m(std)_{1-n}}}$$

Using Method 5, Eq 5-8 to determine intermediate isokinetics at each point, weighted averaging of the cumulative isokinetics is necessary since all points are not equal, and determined by using the dry standard meter volume collected at each point to weight the cumulative average. Intermediate isokinetics and dry standard meter volumes are found at each point. At each point the cumulative sum is found of each value and the quotient of the two used to determine the cumulative isokinetics for each residual point (n).

Pt	In (%)	x	Vm(std)n	=	I (%)n	∑(I (%)n)	/	∑(Vm(std)n)	=	I (%)
A-1	99.54	x	7.754	=	771.81	771.81	/	7.75	=	99.5

Last Pt

Percent Isokinetic (%) (intermediate equation, all points)
[equivalent to taking an average of point-by-point isokinetics without weighting the average (e.g. all points equal)]

$$I(\%) = \frac{K_4 \times \left((t_s)_{avg} + T_u\right) \times V_{m(std)}}{\left(\Theta \times (v_{s(l)})_{avg} \times P_s \times \pi \times \left(\frac{D_{na}}{2} \times \frac{1}{12}\right)^2\right) \times \left(1 - \frac{B_{ws}}{100}\right)}$$

$$I(\%) = \frac{0.0945 \text{ min•in. Hg}}{\text{sec•}^{\circ}\text{R}} \times (182.33\ ^{\circ}\text{F} + 460\ ^{\circ}\text{R}) \times 89.99 \text{ dscf}$$

$$\frac{}{244.50 \text{ min} \times \frac{67.61 \text{ ft}}{\text{sec}} \times 29.98 \text{ in. Hg} \times 3.14 \times \left(\frac{0.16 \text{ in.}}{2} \times \frac{\text{ft.}}{12 \text{ in.}}\right)^2 \times \left(1 - \frac{9.49\ \%}{100}\right)} = 90.59\ \%$$

Raw Data Percent Isokinetic (%)
[utilizes the raw data equation for isokinetics from Method 5]

$$I(\%) = \frac{100\left((t_s)_{avg} + T_u\right)\left[K_4 V_{1c} + \frac{V_m Y}{(t_m)_{avg} + T_u}\left(P_{bar} + \frac{\Delta H}{13.6}\right)\right]}{60\left(\Theta \times (v_{s(l)})_{avg} \times P_s \times \pi \times \left(\frac{D_{na}}{2} \times \frac{1}{12}\right)^2\right)}$$

$$I(\%) = \frac{100 \times (182.33\ ^{\circ}\text{F} + 460\ ^{\circ}\text{R}) \times \left[\frac{0.002669 \text{ ft}^3\text{•in. Hg}}{\text{ml•}^{\circ}\text{R}} \times 200.6 \text{ ml} + \frac{93.65 \text{ dcf} \times 0.978}{80.33\ ^{\circ}\text{F} + 460\ ^{\circ}\text{R}} \times \left(30.05 \text{ in Hg} + \frac{1.176}{13.6}\right)\right]}{}$$

$$\frac{}{60 \times 244.50 \text{ min} \times \frac{67.61 \text{ ft}}{\text{sec}} \times 29.98 \text{ in. Hg} \times 3.14 \times \left(\frac{0.16 \text{ in.}}{2} \times \frac{\text{ft.}}{12 \text{ in.}}\right)^2} = 90.68\ \%$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Gravimetric Analysis) [Values from Run 1 test]

Blank Concentration [Acetone Blank Weight of Solids] (mg/ml)

$$C_x\,(mg/ml) = \frac{1000 \times w_x}{v_x}$$

C_x (mg/ml) = $\frac{1000\ mg}{g}$ x $\frac{0.0000\ g}{200.60\ ml}$ = $\frac{0.0000\ mg}{ml}$ = $\frac{\quad mg}{ml}$

Blank Adjustment [Acetone Blank Weight of Solids and Nozzle Wash PM>10] (mg)

$$W_x\,(mg) = v_x \times C_x$$

W_x (mg) = 70.00 ml x 0.0000 mg/ml = 0.00 mg < Sample Gain

Sample Gain [Nozzle Wash PM>10] (mg)

$$m_x\,(mg) = \left(m_{fx} - m_{tx}\right) \times 1000$$

m_x (mg) = $\frac{1000\ mg}{g}$ x (0.0083 g - 0.00 g) = 8.30 mg

Adjusted Sample Gain [Nozzle Wash PM>10] (mg)

$$m_{xadj}\,(mg) = m_x - W_x$$

m_{xadj} (mg) = 8.30 mg - 0.00 mg = 8.30 mg

0.1N NH_4OH Correction (mg)

$$m_c\,(mg) = 17.03 \times V_t \times N$$

m_c (mg) = 17.03 x 0.00 ml x 0.1 N = 0.00 mg

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Analysis) [Values from Run 1 test - Total PM_{10} Mass]

Stack Total Concentration (g/dscf)

$$c_s(g/dscf) = 0.001 \times \frac{M_n}{V_{m(std)}}$$

$$c_s \text{ (g/dscf)} = \frac{\text{g}}{\text{1000 mg}} \text{ x } \frac{\text{4.20 mg}}{\text{89.99 dscf}} = \frac{\text{4.67E-05 g}}{\text{dscf}}$$

Stack Total Concentration (gr/dscf)

$$c_s'(gr/dscf) = 0.001 \times \frac{M_n}{V_{m(std)}} \times \frac{7000}{453.592}$$

$$c'_s \text{ (gr/dscf)} = \frac{\text{g}}{\text{1000 mg}} \text{ x } \frac{\text{4.20 mg}}{\text{89.99 dscf}} \text{ x } \frac{\text{7000 gr}}{\text{lb}} \text{ x } \frac{\text{lb}}{\text{453.592 g}} = \frac{\text{7.20E-04 gr}}{\text{dscf}}$$

Total Emissions Rate (kg/hr)

$$E(kg/hr) = c_s \times Q_{sd} \times \frac{kg}{1000\ g}$$

$$E \text{ (kg/hr)} = \frac{\text{kg}}{\text{1000 g}} \text{ x } \frac{\text{4.67E-05 g}}{\text{dscf}} \text{ x } \frac{\text{51,441,564 dscf}}{\text{hr}} = \frac{\text{2.40 kg}}{\text{hr}}$$

Total Emissions Rate (lb/hr)

$$E'(lb/hr) = \frac{M_n \times Q_{sd}}{V_{m(std)}} \times \frac{lb \times g}{453.592 g \times 1000 mg}$$

$$E' \text{ (lb/hr)} = \frac{\text{g}}{\text{1000 mg}} \text{ x } \frac{\text{lb}}{\text{453.592 g}} \text{ x } \frac{\text{4.20 mg}}{\text{89.99 dscf}} \text{ x } \frac{\text{51,441,564 dscf}}{\text{hr}} = \frac{\text{5.29 lb}}{\text{hr}}$$

Total Emissions Rate (tpy)

$$E''(ton/yr) = E' \times \frac{8760}{2000}$$

$$E'' \text{ (tpy)} = \frac{\text{ton}}{\text{2000 lb}} \text{ x } \frac{\text{8,760 hr}}{\text{yr}} \text{ x } \frac{\text{5.29 lb}}{\text{hr}} = \frac{\text{23.18 ton}}{\text{yr}}$$

Total Emissions Rate (lb/MMBtu)

Oxygen Based:

$$E'''(lb/MMBtu) = \frac{M_n \times F_d}{V_{m(std)} \times 1000 \times 453.592} \times \left(\frac{20.9}{20.9 - \%O_2}\right)$$

$$E''' \text{ (lb/MMBtu)} = \frac{\text{g}}{\text{1000 mg}} \text{ x } \frac{\text{lb}}{\text{453.592 g}} \text{ x } \frac{\text{4.20 mg}}{\text{89.99 dscf}} \text{ x } \frac{\text{8,641.42 dscf}}{\text{MMBtu}} \text{ x } \left(\frac{\text{20.9}}{\text{20.9 - 11.8 \%}}\right) = \frac{\text{0.0020 lb}}{\text{MMBtu}}$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Constant Flow, Variable Time Isokinetic QA/QC) [Values from Preliminary test]

Stack Gas Viscosity (μP) [based on preliminary data] [RM 201A, Eq. 3]

$$\mu(\mu P) = C_1 + C_2\sqrt{T_s} + C_3 T_s^{-2} + C4(\%O_{2,wet}) - C_5 B_{ws} + C_6 B_{ws} T_s^2$$

μ (μP) = -150.3162 μP + 13.4622 $\sqrt{\quad 180 \quad + 460}$ + 3.86153x10^{6} (180 + 460)$^{-2}$ + 0.591123 (12.8 x (1 - 8.00 /100)
- 91.9723 (8.00 /100) + 1.51761x10^{-5} (8.00 /100)(180 + 460)^2 = 199.79 μP

Cunningham Correction Factor [RM 201A, Eq. 4]
[based on preliminary data for a 2.25 micrometer diameter particle]

$$C = 1 + 0.0057193\left[\frac{\mu}{P_s D_{50}}\right]\left[\frac{T_s}{M_w}\right]^{0.5}$$

$$C = 1 + 0.0057193 \times \left(\frac{199.79\ \mu P}{29.92\ \text{in Hg} \times 2.25\ \mu m}\right)\left(\frac{180 + 460\ ^{o}R}{28.52\ \text{lb / lb-mole}}\right)^{0.5} = 1.08$$

First calculation set using Cyclone I or Cyclone I and IV, assuming N_{re}<3,162

Lower Limit Cut Diameter for Cyclone I (μm) [RM 201A, Eq. 5]
[assumes N_{re}<3,162]

$$D_{50LL}(\mu m) = 9.507 C^{0.3007}\left[\frac{M_w P_s}{T_s}\right]^{0.1993}$$

$$D_{50LL}\ (\mu m) = 9.507 \times 1.08^{\,0.3007} \times \left(\frac{29.92\ \text{in Hg} \times 28.52\ \text{lb / lb-mole}}{180 + 460\ ^{o}R}\right)^{0.1993} = 10.30\ \mu m$$

Cut Diameter for Cyclone I for the Middle of the Overlap Zone (μm) [RM 201A, Eq. 6]
[assumes N_{re}<3,162]

$$D_{50T}(\mu m) = \left(\frac{11 + D_{50LL}}{2}\right)$$

$$D_{50T}\ (\mu m) = \frac{11 + 10.30\ \mu m}{2} = 10.65\ \mu m$$

Sampling Rate Using Both PM_{10} and $PM_{2.5}$ Cyclones (acfm) [RM 201A, Eq. 7]
[assumes N_{re}<3,162]

Qs (acfm) =

$$Q_s(acfm) = Q_I(acfm) = 0.07296(\mu)\left[\frac{T_s}{M_w P_s}\right]^{0.2949}\left[\frac{1}{D_{50T}}\right]^{1.4102}$$

$$0.07296 \times 199.79\ \mu P \times \left(\frac{180 + 460\ ^{o}R}{29.92\ \text{in Hg} \times 28.52\ \text{lb / lb-mole}}\right)^{0.2949} \times \left(\frac{1}{10.65\ \mu m}\right)^{1.4102} = 0.48\ \text{acfm}$$

Reynolds Number (dimensionless) [RM 201A, Eq. 10]
[verification of N_{re}<3,162, using Cyclone I and IV]

$$N_{re} = 8.64 \times 10^5\left[\frac{P_s M_w}{T_s}\right]\left[\frac{Q_s}{\mu}\right]$$

Correct

$$N_{re} = 8.64 \times 10^5 \times \frac{29.92\ \text{in Hg} \times 28.52\ \text{lb / lb-mole}}{180 + 460\ ^{o}R} \times \frac{0.48\ \text{acfm}}{199.79\ \mu P} = 2746.16 < 3{,}162$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Constant Flow, Variable Time Isokinetic QA/QC) [Values from Preliminary test]

Second calculation set using Cyclone IV, assuming N_{re}<3,162

Particle Cut Diameter for N_{re} Less than 3,162 for Cyclone IV (µm) [RM 201A, Eq. 34]
[assumes N_{re}<3,162]

$$D_{50}(\mu m) = 0.0024302 \left[\frac{\mu}{Q_s}\right]^{1.1791} \left[\frac{1}{C}\right]^{0.5} \left[\frac{T_s}{P_s M_w}\right]^{0.6790}$$

D_{50} (µm) =

0.0024302 x (199.79 µP / 0.48 acfm)$^{1.1791}$ x (1 / 1.08)$^{0.5}$ x (180 + 460 °R / 29.92 in Hg x 28.52 lb / lb-mole)$^{0.6790}$ = 2.38 µm

Sampling Rate Using Only $PM_{2.5}$ Cyclone for N_{re} Less than 3,162 (acfm) [RM 201A, Eq. 8]

$$Q_{IV}(acfm) = 0.0060639 \left(\frac{\mu}{C^{0.4242}}\right) \left[\frac{P_s M_w}{T_s}\right]^{-.05759} \left[\frac{1}{D_{50}}\right]^{0.8481}$$

Q_{IV} (acfm) =

0.0060639 x (199.79 µP / 1.08 $^{0.4242}$) x (29.92 in Hg x 28.52 lb / lb-mole / 180 + 460 °R)$^{-0.5759}$ x (1 / 2.38 µm)$^{0.8481}$ = 0.48 acfm

Reynolds Number (dimensionless) [RM 201A, Eq. 10]
[verification of N_{re}<3,162, using Cyclone IV only]

$$N_{re} = 8.64 \times 10^5 \left[\frac{P_s M_w}{T_s}\right]\left[\frac{Q_s}{\mu}\right]$$

Correct

N_{re} = 8.64 x 10^5 x 29.92 in Hg x 28.52 lb / lb-mole / 180 + 460 °R x 0.48 acfm / 199.79 µP = 2746.12 < 3,162

Third calculation set using Cyclone I or Cyclone I and IV, assuming N_{re}≥3,162

Lower Limit Cut Diameter for Cyclone I (µm) [RM 201A, Eq. 12]
[assumes N_{re}≥3,162]

$$D_{50LL}(\mu m) = 10.0959 C^{0.4400} \left[\frac{M_w P_s}{T_s}\right]^{0.0600}$$

D_{50LL} (µm) = 10.0959 x 1.08 $^{0.4400}$ x (29.92 in Hg x 28.52 lb / lb-mole / 180 + 460 °R)$^{0.0600}$ = 10.63 µm

Cut Diameter for Cyclone I for the Middle of the Overlap Zone (µm) [RM 201A, Eq. 6]
[assumes N_{re}≥3,162]

$$D_{50T}(\mu m) = \left(\frac{11 + D_{50LL}}{2}\right)$$

D_{50T} (µm) = (11 + 10.63 µm) / 2 = 10.81 µm

Sampling Rate Using Both PM_{10} and $PM_{2.5}$ Cyclones (acfm) [RM 201A, Eq. 7]
[assumes N_{re}≥3,162]

$$Q_s(acfm) = Q_I(acfm) = 0.07296(\mu) \left[\frac{T_s}{M_w P_s}\right]^{0.2949} \left[\frac{1}{D_{50T}}\right]^{1.4102}$$

Qs (acfm) =

0.07296 x 199.79 µP x (180 + 460 °R / 29.92 in Hg x 28.52 lb / lb-mole)$^{0.2949}$ x (1 / 10.81 µm)$^{1.4102}$ = 0.47 acfm

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

$$D_{50}(\mu m) = 0.019723 \left[\frac{\mu}{Q_s}\right]^{0.8058}\left[\frac{1}{C}\right]^{0.5}\left[\frac{T_s}{P_s M_w}\right]^{0.3058}$$

D_{50} (µm) =

0.019723 x ((199.79 µP) / (0.47 acfm))$^{0.8058}$ x ((1) / (1.08))$^{0.5}$
x ((180 + 460 °R) / (29.92 in Hg x 28.52 lb / lb-mole))$^{0.3058}$ = 2.29 µm

Sampling Rate Using Only $PM_{2.5}$ Cyclone for N_{re} Greater than or Equal to 3,162 (acfm) [RM 201A, Eq. 9]

$$Q_{IV}(acfm) = 0.007657\left(\frac{\mu}{C^{0.6205}}\right)\left[\frac{P_s M_w}{T_s}\right]^{-0.3795}\left[\frac{1}{D_{50}}\right]^{1.241}$$

Q_{IV} (acfm) =

0.007657 x ((199.79 µP) / (1.08 $^{0.6205}$)) x ((29.92 in Hg x 28.52 lb / lb-mole) / (180 + 460 °R))$^{-0.3795}$
x ((1) / (2.29 µm))$^{1.241}$ = 0.47 acfm

Reynolds Number (dimensionless) [RM 201A, Eq. 10]
[verification of N_{re}≥3,162, using Cyclone IV only]

$$N_{re} = 8.64 \times 10^5 \left[\frac{P_s M_w}{T_s}\right]\left[\frac{Q_s}{\mu}\right]$$

Wrong Assumption

N_{re} = 8.64 x 10^5 x (29.92 in Hg x 28.52 lb / lb-mole) / (180 + 460 °R) x (0.48 acfm) / (199.79 µP) = 2746.16 < 3,162

Meter Box Orifice Pressure Drop (in H_2O) [RM 201A, Eq. 11]
As calculated using applicable calculation set 1, 2, 3, or 4

$$\Delta H(inH_2O) = \left[\frac{Q_s(1-B_{ws})P_s}{T_s}\right]^2\left[\frac{1.083 T_m M_d \Delta H_@}{P_{bar}}\right]$$

ΔH (in H_2O) = (0.48 acfm x (1 - 8.00 /100) x 29.92 in Hg) / (180 + 460 °R))^2
x (1.083 x (85.00 + 460 °R) x 29.43 lb / lb-mole x 1.846 in H_2O) / (29.99 in Hg)) = 0.449 in H_2O

50 °F above stack temperature	T_{s+50} =	230	ΔH_{+50} =	0.386 in H_2O
50 °F below stack temperature	T_{s+50} =	130	ΔH_{+50} =	0.528 in H_2O

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Constant Flow, Variable Time Isokinetic QA/QC) [Values from Preliminary test]

Adjusted Velocity Pressure (in H_2O) [point A-1] [RM201A, Eq. 25]

$$\Delta p_s\,(inH_2O) = \Delta p_m \left[\frac{C_p}{C'_p}\right]^2$$

Δp_s (in H_2O) = 1.70 in H_2O x (0.7720 / 0.8198)^2 = 1.51 in H_2O

Average Probe Blockage Factor [RM201A, Eq. 26]

$$b_f = \frac{22.0}{A}$$

b_f = 22.0 / 40828.14 in^2 = 5.39E-04

Velocity Pressure Adjusted for Blockage Factor (in H_2O) [point A-1] [RM201A, Eq. 27]

Target PM and/or Stack Size Not Applicable to Blockage Factor Calculation

$$\Delta p_{s2}\,(inH_2O) = \Delta p_{s1}\left[\frac{1}{(1-b_f)}\right]^2$$

Δp_s (in H_2O) = 1.51 in H_2O x (1 / (1 - 0.00E+00))^2 = 1.51 in H_2O

Velocity of Stack Gas Adjusted for Blockage Factor and/or C_p / C'_p (ft/sec) [RM201A, Eq. 13]

Target PM and/or Stack Size Not Applicable to Blockage Factor Calculation

$$v_s = K_p C_p \left(\sqrt{(\Delta p)}\right)_{avg}\left[\sqrt{\frac{T_s}{P_s M_w}}\right]$$

v_s (ft/sec) =

85.49 ft/sec / lb/mole - °R x 0.7720 x 1.16 x (180 + 460 °R / 29.92 in Hg x 28.52 lb / lb-mole)$^{0.5}$ = 66.24 ft/sec

Calculated Nozzle Diameter for Acceptable Sampling Rate (in) [RM201A, Eq. 14]

$$D(in) = \left[\frac{3.056 Q_s}{v_s}\right]^{0.5}$$

D (in) = (3.056 x 0.48 acfm / 66.24 ft/sec)$^{0.5}$ = 0.148 in

Represents ideal diameter, which we then compare to capabilities of all nozzles from multiple sets

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Constant Flow, Variable Time Isokinetic QA/QC) [Values from Preliminary test]

Velocity of Gas in Nozzle 4a (diam. = 0.157 in), (ft/sec) [RM201A, Eq. 15]

$$v_n = \frac{\left(\frac{Q_s}{60\ \frac{\text{min}}{\text{sec}}}\right)}{A_n}$$

v_n (ft/sec) = $\frac{0.48 \quad \text{acfm}}{60 \text{ min / sec}}$ / 1.34E-04 ft^2 = 59.06 $\frac{\text{ft}}{\text{sec}}$

Example set of calculations for nozzle used with run 1

Minimum Nozzle Velocity to Stack Velocity Ratio Parameter (dimensionless) [RM201A, Eq. 16]

Nozzle 4a (diam. = 0.157 in)

$$R_{\text{min}} = \left[0.2457 + \left(0.3072 - \frac{0.2603\ (\mu)(Q_s)^{0.5}}{v_n^{1.5}}\right)^{0.5}\right]$$

R_{min} =

$0.2457 + (0.3072 - \frac{0.2603 \text{ x } 199.79 \text{ µP x } (0.48 \text{ acfm})^{0.5}}{59.06 \text{ in}^{1.5}})^{0.5}$ = 0.72

Maximum Nozzle Velocity to Stack Velocity Ratio Parameter (dimensionless) [RM201A, Eq. 17]

Nozzle 4a (diam. = 0.157 in)

$$R_{\text{max}} = \left[0.4457 + \left(0.5690 + \frac{0.2603\ (\mu)(Q_s)^{0.5}}{v_n^{1.5}}\right)^{0.5}\right]$$

R_{max} =

$0.4457 + (0.5690 + \frac{0.2603 \text{ x } 199.79 \text{ µP x } (0.48 \text{ acfm})^{0.5}}{59.06 \text{ in}^{1.5}})^{0.5}$ = 1.25

Minimum Gas Velocity for R_{min} Less than 0.5 (ft/sec) **Nozzle 4a (diam. = 0.157 in)**

$$v_{\text{min}}\ (ft / \text{sec}) = v_n (0.5)$$

v_{min} (ft/sec) = 0.5 x $\frac{\text{ft}}{\text{sec}}$ = $\frac{\text{ft}}{\text{sec}}$ **[RM201A, Eq. 18]**

Not Applicable

Minimum Gas Velocity for R_{min} Greater than or Equal to 0.5 (ft/sec) **Nozzle 4a (diam. = 0.157 in)**

$$v_{\text{min}}\ (ft / \text{sec}) = v_n R_{\text{min}}$$

v_{min} (ft/sec) = 59.06 $\frac{\text{ft}}{\text{sec}}$ x 0.72 = 42.72 $\frac{\text{ft}}{\text{sec}}$ **[RM201A, Eq. 19]**

Maximum Gas Velocity for R_{max} Less than 1.5 (ft/sec) **Nozzle 4a (diam. = 0.157 in)**

$$v_{\text{max}}\ (ft / \text{sec}) = v_n R_{\text{max}}$$

v_{max} (ft/sec) = 59.06 $\frac{\text{ft}}{\text{sec}}$ x 1.25 = 73.86 $\frac{\text{ft}}{\text{sec}}$ **[RM201A, Eq. 20]**

Maximum Gas Velocity for R_{max} Greater than or Equal to 1.5 (ft/sec) **Nozzle 4a (diam. = 0.157 in)**

$$v_{\text{max}}\ (ft / \text{sec}) = v_n (1.5)$$

v_{max} (ft/sec) = 1.5 x $\frac{\text{ft}}{\text{sec}}$ = $\frac{\text{ft}}{\text{sec}}$ **[RM201A, Eq. 21]**

Not Applicable

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Constant Flow, Variable Time Isokinetic QA/QC) [Values from Preliminary test]

Minimum Velocity Pressure (in H_2O) [RM201A, Eq. 22] **Nozzle 4a (diam. = 0.157 in)**

Run 1 nozzle is able to achieve Δp_{min} below preliminary data minimum

$$\Delta p_{min}\ (inH_2O) = 1.3686 \times 10^{-4}\left[\frac{P_s M_w}{T_s}\right]\left[\frac{v_{min}}{C_p}\right]^2$$

Δp_{min} (in H_2O) =

$1.3686 \times 10^{-4} \times \left(\frac{29.92 \text{ in Hg} \times 28.52 \text{ lb / lb-mole}}{180 + 460\ ^{o}R}\right) \times \left(\frac{42.72 \text{ ft/sec}}{0.7720}\right)^2 =$ 0.56 in H_2O vs. 1.15

Maximum Velocity Pressure (in H_2O) [RM201A, Eq. 23] **Nozzle 4a (diam. = 0.157 in)**

Run 1 nozzle is able to achieve Δp_{max} above preliminary data maximum

$$\Delta p_{max}\ (inH_2O) = 1.3686 \times 10^{-4}\left[\frac{P_s M_w}{T_s}\right]\left[\frac{v_{max}}{C_p}\right]^2$$

Δp_{max} (in H_2O) =

$1.3686 \times 10^{-4} \times \left(\frac{29.92 \text{ in Hg} \times 28.52 \text{ lb / lb-mole}}{180 + 460\ ^{o}R}\right) \times \left(\frac{73.86 \text{ ft/sec}}{0.7720}\right)^2 =$ 1.67 in H_2O vs. 1.51

EXAMPLE CALCULATIONS (Constant Flow, Variable Time Isokinetic QA/QC) [Values from Run 1 test]

Sampling Dwell Time at Each Point (minutes) [point A-1] [RM201A, Eq. 24]

$$t_n(\text{min}) = \left[\frac{C_p\sqrt{\Delta p_n}}{C_p'\left(\sqrt{\Delta p_n}\right)_{avg}}\right]\left[\frac{t_r}{N_{tp}}\right]$$

t_n (min) = $\left(\frac{0.7720 \times \left(\frac{1.30}{1.16}\right)^{0.5}}{0.7720}\right) \times \left(\frac{240.00 \text{ min}}{12.00}\right) =$ 19.68 minutes

Dry Gas Volume Sampled at Standard Conditions (dscf) [point A-1] [RM201A, Eq. 28]

$$v_{ms}(dscf) = \left[\frac{528}{29.92}\right][\gamma \cdot v_m]\left[\frac{\left(P_{bar} + \frac{\Delta H}{13.6}\right)}{T_m}\right]$$

v_{ms} (dscf) = $\left(\frac{528}{29.92}\right)$ (0.978 x 7.99 dcf) x

$\left(\frac{30.05 \text{ in Hg} + 0.45 \text{ in } H_2O / 13.6}{75.00 + 460\ ^{o}R}\right) =$ 7.75 dscf

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Constant Flow, Variable Time Isokinetic QA/QC) [Values from Run 1 test]

Sample Flow Rate at Standard Conditions (dscfm) [RM201A, Eq. 29]

$$Q_{sST}\,(dscfm) = \frac{v_{ms}}{\Theta}$$

Q_{sST} (dscfm) = $\frac{89.99 \text{ dscf}}{244.50 \text{ min}}$ = $\frac{0.37 \text{ dscf}}{\text{min}}$

Sampling Rate (acfm) [e.g. cyclone flow rate] [RM201A, Eq. 32]

$$Q_s(acfm) = \frac{29.92}{528} Q_{sST} \left[\frac{1}{(1 - B_{ws})}\right]\left[\frac{T_s}{P_s}\right]$$

Q_s (acfm) = $\frac{29.92 \text{ in Hg}}{528\ ^{o}\text{R}}$ x $\frac{0.37 \text{ dscf}}{\text{min}}$ x $\frac{1}{(1- 9.49 /100)}$ x $\frac{182 + 460\ ^{o}\text{R}}{29.98 \text{ in Hg}}$ = 0.49 acfm

Actual Conditions Reynolds Number (dimensionless) [RM 201A, Eq. 10]

$$N_{re} = 8.64 \times 10^5 \left[\frac{P_s M_w}{T_s}\right]\left[\frac{Q_s}{\mu}\right]$$

N_{re} = 8.64 x 10^5 x $\frac{29.98 \text{ in Hg x } 28.22 \text{ lb / lb-mole}}{182 + 460\ ^{o}\text{R}}$ x $\frac{0.49 \text{ acfm}}{198.41 \text{ µP}}$ = 2831.81

Actual Conditions Particle Cut Diameter for Cyclone I (µm) [RM201A, Eq. 33]

$$D_{50}(\mu m) = 0.15625 \left[\frac{T_s}{M_w P_s}\right]^{0.2091}\left[\frac{\mu}{Q_s}\right]^{0.7091}$$

D_{50} (µm) = 0.15625 x ($\frac{182 + 460\ ^{o}\text{R}}{29.98 \text{ in Hg x } 28.22 \text{ lb / lb-mole}}$)$^{0.2091}$ x ($\frac{198.41 \text{ µP}}{0.49 \text{ acfm}}$)$^{0.7091}$ = 10.36 µm

Actual Particle Cut Diameter for Cyclone IV is determined by:

Actual Conditions Cunningham Correction Factor [RM 201A, Eq. 4]
[for a 2.5 micrometer diameter particle (estimated size)]

$$C = 1 + 0.0057193\left[\frac{\mu}{P_s D_{50}}\right]\left[\frac{T_s}{M_w}\right]^{0.5}$$

C = 1 + 0.0057193 x ($\frac{198.41 \text{ µP}}{29.98 \text{ in Hg x } 2.5 \text{ µm}}$)($\frac{182 + 460\ ^{o}\text{R}}{28.22 \text{ lb / lb-mole}}$)$^{0.5}$ = 1.07

Actual Conditions Particle Cut Diameter for N_{re} Less than 3,162 for Cyclone IV (µm) [RM 201A, Eq. 34]

$$D_{50}(\mu m) = 0.0024302\left[\frac{\mu}{Q_s}\right]^{1.1791}\left[\frac{1}{C}\right]^{0.5}\left[\frac{T_s}{P_s M_w}\right]^{0.6790}$$

D_{50} (µm) =

0.0024302 x ($\frac{198.41 \text{ µP}}{0.49 \text{ acfm}}$)$^{1.1791}$ x ($\frac{1}{1.07}$)$^{0.5}$

x ($\frac{182 + 460\ ^{o}\text{R}}{29.98 \text{ in Hg x } 28.22 \text{ lb / lb-mole}}$)$^{0.6790}$ = 2.29 µm

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Constant Flow, Variable Time Isokinetic QA/QC) [Values from Run 1 test]

Actual Conditions Particle Cut Diameter for N_{re} Greater than or Equal to 3,162 for Cyclone IV (µm) [RM 201A, Eq. 35]

$$D_{50}(\mu m) = 0.019723 \left[\frac{\mu}{Q_s}\right]^{0.8058} \left[\frac{1}{C}\right]^{0.5} \left[\frac{T_s}{P_s M_w}\right]^{0.3058}$$

D_{50} (µm) =

0.019723 x (µP / acfm)$^{0.8058}$ x (1)$^{0.5}$ x (+ 460 °R / in Hg x lb / lb-mole)$^{0.3058}$ = µm

Re-calculated Cunningham Correction Factor (dimensionless) [RM 201A, Eq. 36]

$$C_r = 1 + 0.0057193 \left[\frac{\mu}{P_s D_{50}}\right]\left[\frac{T_s}{M_w}\right]^{0.5}$$

C = 1 + 0.0057193 x (198.41 µP / 29.98 in Hg x 2.29 µm)(182 + 460 °R / 28.22 lb / lb-mole)$^{0.5}$ = 1.08

Re-calculated Particle Cut Diameter for N_{re} Less than 3,162 for Cyclone IV (µm) [RM 201A, Eq. 37]

$$D_{50-1}(\mu m) = 0.0024302 \left[\frac{\mu}{Q_s}\right]^{1.1791} \left[\frac{1}{C}\right]^{0.5} \left[\frac{T_s}{P_s M_w}\right]^{0.6790}$$

D_{50-1} (µm) =

0.0024302 x (198.41 µP / 0.49 acfm)$^{1.1791}$ x (1 / 1.08)$^{0.5}$ x (182 + 460 °R / 29.98 in Hg x 28.22 lb / lb-mole)$^{0.6790}$ = 2.28 µm

Re-Calculated Particle Cut Diameter for N_{re} Greater than or Equal to 3,162 for Cyclone IV (µm) [RM 201A, Eq. 38]

$$D_{50-1}(\mu m) = 0.019723 \left[\frac{\mu}{Q_s}\right]^{0.8058} \left[\frac{1}{C}\right]^{0.5} \left[\frac{T_s}{P_s M_w}\right]^{0.3058}$$

D_{50-1} (µm) =

0.019723 x (µP / acfm)$^{0.8058}$ x (1)$^{0.5}$ x (+ 460 °R / in Hg x lb / lb-mole)$^{0.3058}$ = µm

Ratio (Z) Between D_{50} and D_{50-1} Values (dimensionless) [RM 201A, Eq. 39]

$$Z = \frac{D_{50-1}}{D_{50}} \qquad 0.99 \le \left[Z = \left(\frac{D_{50}}{D_{50-1}}\right)\right] \le 1.01$$

Z = 2.28 µm / 2.28 µm = 1.00

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 1 - Circular Stack)

Diameter of Stack (in.)

$$D(in.) = L_{fw} - L_{nw}$$

D (in.) = 236.00 in. - 8.00 in. = 228.00 in.

Stack Diameters Downstream

$$B_D\,(dia.) = \frac{B}{D}$$

B_D (dia.) = $\frac{850.00 \text{ in.}}{228.00 \text{ in.}}$ = 3.73 diameters

Area of Stack (ft^2)

$$A_s\,(ft^2) = \pi \times \left(\frac{D}{2 \times 12}\right)^2$$

A_s (ft^2) = 3.14 x ($\frac{228.00 \text{ in.}}{2 \text{ x } 12 \text{in./ft}}$)^2 = 283.53 ft^2

Stack Diameters Upstream

$$A_D\,(dia.) = \frac{A}{D}$$

A_D (dia.) = $\frac{200.40 \text{ in.}}{228.00 \text{ in.}}$ = 0.88 diameters

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Reference Method 4) [Values from Run 1 test]

Water Volume Weighed (scf)

$$V_{wsg\ (std)}(scf) = W_t \times K_5$$

$V_{wsg(std)}$ = 91.10 g x 0.04715 ft^3/g = 4.295 scf

Standard Meter Volume (dscf)

$$V_{m(std)}(dscf) = \frac{K_1 \times Y \times V_m \times \left(P_b + \frac{\Delta H_{avg}}{13.6}\right)}{(t_m)_{avg} + T_u}$$

$$V_{m(std)} = \frac{\frac{17.65\ ^\circ R}{in.\ Hg} \times 0.97 \times 41.73\ dcf \times \left(30.07\ in.\ Hg + \frac{0.41\ in.\ H_2O}{13.6\ in.\ H_2O / in.\ Hg}\right)}{62.79\ ^\circ F + 460\ ^\circ R} = 41.30\ dscf$$

Calculated Moisture Content (%)

$$B_{ws(calc)}(\%) = 100 \times \frac{V_{wsg(std)}}{V_{wsg(std)} + V_{m(std)}}$$

$$B_{ws(calc)} = 100 \times \frac{4.30\ dscf}{4.30\ dscf + 41.30\ dscf} = 9.42\ \%$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (Analysis) [Values from Run 1 test - H_2SO_4 (IC)]

Stack H_2SO_4 Mass (mg)

$$M_n(mg) = \frac{M_{n(lab)}}{V_{s(lab)}} \times V_{sample} \times \frac{L}{1000ml}$$

M_n (mg) = $\frac{\text{L}}{\text{1000 ml}}$ x 0.10 $\frac{\text{mg}}{\text{L}}$ x 166.00 ml = 0.02 mg

Stack H_2SO_4 Concentration (g/dscf)

$$c_s(g/dscf) = 0.001 \times \frac{M_n}{V_{m(std)}}$$

c_s (g/dscf) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{0.02 mg}}{\text{41.30 dscf}}$ = $\frac{\text{4.10E-07 g}}{\text{dscf}}$

Stack H_2SO_4 Concentration (gr/dscf)

$$c'_s(gr/dscf) = 0.001 \times \frac{M_n}{V_{m(std)}} \times \frac{7000}{453.592}$$

c'$_s$ (gr/dscf) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{0.02 mg}}{\text{41.30 dscf}}$ x $\frac{\text{7000 gr}}{\text{lb}}$ x $\frac{\text{lb}}{\text{453.592 g}}$ = $\frac{\text{6.35E-06 gr}}{\text{dscf}}$

Stack H_2SO_4 Concentration (g/L)

$$c''_s(g/L) = c'_s \times \frac{dscf}{28.31685 dsL}$$

c'$_s$ (gr/dscf) = 4.12E-07 $\frac{\text{g}}{\text{dscf}}$ x $\frac{\text{dscf}}{\text{28.31685 dsL}}$ = $\frac{\text{1.00E-08 g}}{\text{L}}$

Stack H_2SO_4 Concentration (ppmvd)

$$c'''_s(ppmvd) = \frac{M_n}{V_{m(std)}} \times Ideal\ Gas\ Constant \times \frac{10^6 parts}{million\ parts} \times \frac{1}{Mol\ Wt}$$

c'''$_s$ (ppmvd) = 1.45E-08 $\frac{\text{g}}{\text{L}}$ x $\frac{\text{24.04 L gas}}{\text{lb-mol}}$ x $\frac{10^6 \text{ parts}}{\text{MM parts}}$ x $\frac{\text{lb-mol}}{\text{98.0790 lb}}$ = 0.004 ppmvd

H_2SO_4 Emissions Rate (lb/MMBtu)

Oxygen Based:

$$E'''(lb/MMBtu) = \frac{M_n \times F_d}{V_{m(std)} \times 1000 \times 453.592} \times \left(\frac{20.9}{20.9 - \%O_2}\right)$$

E''' (lb/MMBtu) = $\frac{\text{g}}{\text{1000 mg}}$ x $\frac{\text{lb}}{\text{453.592 g}}$ x $\frac{\text{0.02 mg}}{\text{41.30 dscf}}$ x $\frac{\text{8,641.42 dscf}}{\text{MMBtu}}$ x ($\frac{\text{20.9}}{\text{20.9 - 12.9 \%}}$) = $\frac{\text{0.00002 lb}}{\text{MMBtu}}$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EMISSION DATA RECORDS

Reference Method Data
Base Load
NOx, CO, VOC, and NH_3

Cricket Valley Energy Center LLC
April 15, 2020
General Electric, 7F.05, Unit #U-00003
Cricket Valley Energy Center

Fuel Data

Fuel Fd factor	8,638	SCF exh/MMBtu
Fuel Heating Value (HHV)	1,014	Btu/SCF fuel
Turbine Fuel Flow	1,651	lb/min
Duct Burner Fuel Flow	0	lb/min
Total Fuel Flow	2,293,723	SCFH

Weather Data

Barometric Pressure	29.99	in. Hg
Relative Humidity	23	%
Ambient Temperature	53	° F
Specific Humidity	0.001939	lb H_2O / lb air

Unit Data

Unit Load	237.6	megawatts
Heat Input	2,327	MMBtu/hr
NH_3 Flow Rate	142	lb/hr
Meas. Stack Moisture	8.8	%
Stack Exhaust Flow (M19)	52,372,088	SCFH

General Electric, 7F.05, Unit #U-00003
Cricket Valley Energy Center

Fuel Data

Fuel Fd factor	8,638	SCF exh/MMBtu
Fuel Heating Value (HHV)	1,014	Btu/SCF fuel
Turbine Fuel Flow	1,646	lb/min
Duct Burner Fuel Flow	0	lb/min
Total Fuel Flow	2,287,005	SCFH

Weather Data

Barometric Pressure	30.11	in. Hg
Relative Humidity	25	%
Ambient Temperature	54	°F
Specific Humidity	0.002178	lb H_2O / lb air

Unit Data

Unit Load	237.1	megawatts
Heat Input	2,320	MMBtu/hr
NH_3 Flow Rate	135	lb/hr
Meas. Stack Moisture	8.8	%
Stack Exhaust Flow (M19)	52,469,624	SCFH

Source Information	
Plant Name	Cricket Valley Energy Center
Sampling Location	U-00003 Base
Fuel Type	Gas, Natural

Test Information			
Project #		bec-19-cricketvalley.ny-start#3	
Operator		Rob White	
Date for Preliminary Run	(mm/dd/yy)	04/15/20	
Standard Temperature		68	°F
Standard Pressure		29.92	in Hg
Required Sample Vol.	indust. spec.	50	scf
Run Duration	chk Subpart	240	minutes
Unit Number		U-00003	
Base Run Number		PM U-00003 Base	
Number of Ports Available		4	
Number of Ports Used		4	
Port Inside Diameter		6.00	in
Stack Shape		Circular

METHOD 1 - SAMPLE AND VELOCITY TRAVERSES FOR CIRCULAR SOURCES

Plant Name	Cricket Valley Energy Center	**Date**	04/15/20
Sampling Location	U-00003 Base	**Stack Type**	Circular
Operator	Rob White	**Ports Available**	4
Project #	bec-19-cricketvalley.ny-start#3	**Ports Used**	4
Stack Size	Large (>24 inch diameter)	**Port ID (inches)**	6.00

Circular Stack or Duct Diameter			
Distance to Far Wall of Stack	(L_{fw})	236.00	in
Distance to Near Wall of Stack	(L_{nw})	8.00	in
Diameter of Stack	(D)	228.00	in
Area of Stack	(A_s)	283.53	ft²

Distance from Port to Disturbances			
Distance Upstream	(A)	200.40	in
Diameters Upstream	(A_D)	0.88	diameters
Distance Downstream	(B)	850.00	in
Diameters Downstream	(B_D)	3.73	diameters

Number of Traverse Points Required			
Diameters to Flow Disturbance		**Minimum Number of[1] Traverse Points**	
Down Stream	**Up Stream**	**Particulate Points**	**Velocity Points**
2.00-4.99	0.50-1.24	24	16
5.00-5.99	1.25-1.49	20	16
6.00-6.99	1.50-1.74	16	12
7.00-7.99	1.75-1.99	12	12
>= 8.00	>=2.00	8 or 12[2]	8 or 12[2]
Upstream Spec		24	16
Downstream Spec		24	16
Traverse Pts Required		24	16

[1] Check Minimum Number of Points for the Upstream and Downstream conditions, then use the largest.

[2] 8 for Circular Stacks 12 to 24 inches
12 for Circular Stacks over 24 inches

○ Method 1 Trav

◉ 12 Point PM Trav (M201a ONLY)

○ Velocity

Number of Traverse Points Used			
4	**Ports by**	3	**Across**
12	**Pts Used**	12	**Required**

Location of Traverse Points in Circular Stacks

METHOD 2 - DETERMINATION OF STACK GAS VELOCITY AND VOLUMETRIC FLOW RATE

Plant Name	Cricket Valley Energy Center			
Sampling Location	U-00003 Base			
Operator	Rob White			
Project #	bec-19-cricketvalley.ny-start#3			
Pitot Leak Check	x	**PreTest**	x	**PostTest**

Preliminary Run Date	04/15/20		
Stack Type	Circular		
Ports Available	4		
Thermocouple ID	SAMP-HP-0138		
Pitot Coefficient	0.8198	**Pitot Identification**	4187

RM 201A or OTM 27 Blckag.	**RM 201A or OTM 27 Pitot Coeff.**
5.39E-04	0.7720

Stack Dimensions			
Area of Stack	(A_s)	283.53	ft²
Diameter of Stack	(D)	228.00	in

Pressures			
Barometric Pressure	(P_b)	29.94	in Hg
Static Pressure	(P_{static})	-0.92	in H_2O
Absolute Stack Pressure	(P_s)	29.87	in Hg

Stack Gas Composition			
Composition Data:	**Estimated Composition**		
Carbon Dioxide Concentration	($\%CO_2$)	4.90	%vd
Oxygen Concentration	($\%O_2$)	13.00	%vd
Carbon Monoxide Concentration	(ppmCO)	0.00	ppmvd
Nitrogen Concentration	($\%N_2$)	82.10	%vd
Stack Moisture Content	(B_{ws})	8.00	%
Stack Dry Molecular Weight	(M_d)	29.30	lb/lb-mole
Stack Wet Molecular Weight	(M_w)	28.40	lb/lb-mole

Results			
Avg Stack Gas Velocity	(v_s)	68.88	ft/sec
Avg Stack Dry Std Flow Rate	(Q_{sd})	50,648,445	dscf/hr
Avg Stack Dry Std Flow Rate	(Q_{sd})	844,141	dscf/min
Avg Stack Wet Flow Rate	(Q_{aw})	1,171,822	acf/min
Avg Stack Wet Std Flow Rate	(Q_{sw})	55,052,658	ascf/hr

40 CFR 60, Method 2G, Section 8.11.1 (but applies to all Method 2 type static pressure measurements):
If a Type S probe is used for this measurement, position the probe at or between any traverse point(s) and rotate the probe until a null differential pressure reading is obtained. Disconnect the tubing from one of the pressure ports; read and record the ΔP. For pressure devices with one-directional scales, if a deflection in the positive direction is noted with the negative side disconnected, then the static pressure is positive. Likewise, if a deflection in the positive direction is noted with the positive side disconnected, then the static pressure is negative.

Stack Cross Section Schematic

Notes:

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Δp_{max}	1.785	in H_2O

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

METHOD 8A (CONTROLLED CONDENSATE) SOURCE SAMPLING TITLE PAGE ISOKINETIC SAMPLING DATA

Plant Name	Cricket Valley Energy Center
Sampling Location	U-00003 Base
Project #	bec-19-cricketvalley.ny-start#3

Date	04/16/20
Operator	GT
Run Number	SAM U-00003 Base-3

Filter #
R0001

Ideal Nozzle Diameter and IsoKinetic Factor Setup			
Pitot Coefficient / ID	(C_p)		
Average Stack Temp	(t_s)	182.0	°F
Average Meter Temp	(t_m)	58.4	
Orifice Meter Coefficient	($\Delta H@$)	1.878	in H_2O
Square Root ΔP	($\Delta p^{1/2}_{avg}$)		in H_2O
Stack Moisture Content	(B_{ws})	8.16	%
Stack Dry Molecular Weight	(M_d)	29.24	lb/lb-mole
Estimated Orifice Flow Rate	(Q_m)	0.34	acfm
ΔP to ΔH Isokinetic Factor	(K)		

Leak Checks		*[change]*		*[level]*		*[time]*	
Train	**Pre**	0.000	ft³/min@	15.0	in Hg for	60.0	sec [≥60]
PASS	**Post**	0.000	ft³/min@	15.0	in Hg for	60.0	sec [≥60]
Pitot	**Pre (+)**		in H_2O		in H_2O for		sec [≥15]
	Pre (-)		in H_2O		in H_2O for		sec [≥15]
	Post (+)		in H_2O		in H_2O for		sec [≥15]
	Post (-)		in H_2O		in H_2O for		sec [≥15]

Sampling Equipment			
Meter Box Number	samp-cp-0030		
Meter Cal Factor	(Y)	0.974	
Nozzle Number	NA		
Average Nozzle Diameter	(D_{na})		in
Suggested Nozzle Diameter	(D_{ni})		in
Probe Number	SAMP-HP-0138		in
Probe Length	72		in
Liner Material	glass		
Sample Case / Oven Number	samp-bh-0013		
Impinger Case Number	samp-bc-0032		

Pressures			
Barometric Pressure	(P_b)	30.06	in Hg
Stack Static Pressure	(P_{static})	-0.92	in H_2O
Absolute Stack Pressure	(P_s)	29.99	in Hg
Absolute Meter Pressure	(P_m)	30.20	in Hg

Nozzle Measurements			**ID: NA**
Pre			**PASS**
Post			**PASS**

VISUAL EMISSIONS OBSERVATION FORM

Form Number (AHI Project Code) Page 6 of 6

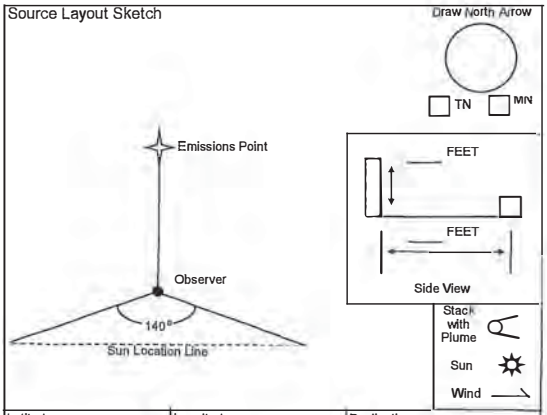
Continued on Form Number (AHI Project Code)

Company Name: Air Hygiene
Facility Name: Crickot Valley Energy Plant
Street Address: 1600 W Tacoma St
City: Broken Arrow State: OK Zip: 74012

Observation Date | Time Zone | Start Time: 8:30 | End Time: 9:00

Process | Unit #: 3 | Operating Mode
Control Equipment | Operating Mode

Describe Emissions Pont



Height of Emiss. Pt. Start 147 End 147 | Height of Emiss. Pt. Rel. to Observer Start 153' End 153'
Distance to Emiss. Pt. Start 8' End 8' | Direction to Emiss. Pt. (Degrees) Start NW End NW

Vetical Angle to Obs. Pt. Start 12 End 12 | Direction to Obs. Pt. (Degrees) Start End
Distance and Direction to Observation Point from Emission Point Start 149' End 149'

Describe Emissions Start NA End NA
Emission Color Start NA End NA | Water Droplet Plume Start NA End NA

Describe Plume Background Start End
Background Color Start Blue End Blue | Sky Conditions Start Clear End Clear
Wind Speed Start 11 End 11 | Wind Direction Start NW End NW
Ambient Temp. Start End | Wet Bulb Temp. | RH Percent

Source Layout Sketch

Additional Information

EMISSION DATA RECORDS

Reference Method Data
Base+DB Load
NOx, CO, VOC, and NH_3

Cricket Valley Energy Center LLC
April 16, 2020
General Electric, 7F.05, Unit #U-00003
Cricket Valley Energy Center

Fuel Data

Fuel Fd factor	8,641	SCF exh/MMBtu
Fuel Heating Value (HHV)	1,010	Btu/SCF fuel
Turbine Fuel Flow	1,681	lb/min
Duct Burner Fuel Flow	174	lb/min
Total Fuel Flow	2,578,392	SCFH

Weather Data

Barometric Pressure	29.99	in. Hg
Relative Humidity	54	%
Ambient Temperature	43	°F
Specific Humidity	0.003133	lb H_2O / lb air

Unit Data

Unit Load	240.3	megawatts
Heat Input	2,603	MMBtu/hr
NH_3 Flow Rate	164	lb/hr
Meas. Stack Moisture	9.5	%
Stack Exhaust Flow (M19)	52,449,328	SCFH

METHOD 1 - SAMPLE AND VELOCITY TRAVERSES FOR CIRCULAR SOURCES

Plant Name	Cricket Valley Energy Center	**Date**	04/16/20
Sampling Location	U-00003 Base+DB	**Stack Type**	Circular
Operator	Rob White	**Ports Available**	4
Project #	bec-19-cricketvalley.ny-start#3	**Ports Used**	4
Stack Size	Large (>24 inch diameter)	**Port ID (inches)**	6.00

Circular Stack or Duct Diameter			
Distance to Far Wall of Stack	(L_{fw})	236.00	in
Distance to Near Wall of Stack	(L_{nw})	8.00	in
Diameter of Stack	(D)	228.00	in
Area of Stack	(A_s)	283.53	ft²

Distance from Port to Disturbances			
Distance Upstream	(A)	200.40	in
Diameters Upstream	(A_D)	0.88	diameters
Distance Downstream	(B)	850.00	in
Diameters Downstream	(B_D)	3.73	diameters

Number of Traverse Points Required			
Diameters to Flow Disturbance		**Minimum Number of[1] Traverse Points**	
Down Stream	**Up Stream**	**Particulate Points**	**Velocity Points**
2.00-4.99	0.50-1.24	24	16
5.00-5.99	1.25-1.49	20	16
6.00-6.99	1.50-1.74	16	12
7.00-7.99	1.75-1.99	12	12
>= 8.00	>=2.00	8 or 12[2]	8 or 12[2]
Upstream Spec		24	16
Downstream Spec		24	16
Traverse Pts Required		24	16

[1] Check Minimum Number of Points for the Upstream and Downstream conditions, then use the largest.

[2] 8 for Circular Stacks 12 to 24 inches
12 for Circular Stacks over 24 inches

Sampling Location	U-00003 Base+DB			
Operator	Rob White			
Project #	bec-19-cricketvalley.ny-start#3			
Pitot Leak Check	x	**PreTest**	x	**PostTest**

Preliminary Run Date	04/16/20		
Stack Type	Circular		
Ports Available	4		
Thermocouple ID	SAMP-HP-0138		
Pitot Coefficient	0.8198	**Pitot Identification**	4187

RM 201A or OTM 27 Blckag.	**RM 201A or OTM 27 Pitot Coeff.**
5.39E-04	0.7720

Stack Dimensions			
Area of Stack	(A_s)	283.53	ft²
Diameter of Stack	(D)	228.00	in

Pressures			
Barometric Pressure	(P_b)	29.99	in Hg
Static Pressure	(P_{static})	-0.96	in H_2O
Absolute Stack Pressure	(P_s)	29.92	in Hg

Stack Gas Composition			
Composition Data:	**Estimated Composition**		
Carbon Dioxide Concentration	($\%CO_2$)	5.76	%vd
Oxygen Concentration	($\%O_2$)	12.78	%vd
Carbon Monoxide Concentration	(ppmCO)	0.00	ppmvd
Nitrogen Concentration	($\%N_2$)	81.46	%vd
Stack Moisture Content	(B_{ws})	8.00	%
Stack Dry Molecular Weight	(M_d)	29.43	lb/lb-mole
Stack Wet Molecular Weight	(M_w)	28.52	lb/lb-mole

Results			
Avg Stack Gas Velocity	(v_s)	66.24	ft/sec
Avg Stack Dry Std Flow Rate	(Q_{sd})	51,309,129	dscf/hr
Avg Stack Dry Std Flow Rate	(Q_{sd})	855,152	dscf/min
Avg Stack Wet Flow Rate	(Q_{aw})	1,126,852	acf/min
Avg Stack Wet Std Flow Rate	(Q_{sw})	55,770,793	ascf/hr

40 CFR 60, Method 2G, Section 8.11.1 (but applies to all Method 2 type static pressure measurements):
If a Type S probe is used for this measurement, position the probe at or between any traverse point(s) and rotate the probe until a null differential pressure reading is obtained. Disconnect the tubing from one of the pressure ports; read and record the ΔP. For pressure devices with one-directional scales, if a deflection in the positive direction is noted with the negative side disconnected, then the static pressure is positive. Likewise, if a deflection in the positive direction is noted with the positive side disconnected, then the static pressure is negative.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

Z must be between 0.99 and 1.01, but the initial calculation is based on assumptions of the Cunniham Correction Factor and the Reynolds Number. In cases where your Z value is not between the limits and is producing an error, you need to run a second iteration based on the re-calculated numbers. To do this, copy the value in "Recalculated Cunninham, C =" [BH189] and do a "paste special value only" into "Calculated Cunninham, C =" [BH174]. This sets the initially calculated C equal to the C determined during this test run. At this point the program may recognize the second iteration and your error may go away. If it doesn't it is probably because it is having difficulties deciding between the Reynolds number at the threshold.

METHOD 8A (CONTROLLED CONDENSATE) SOURCE SAMPLING TITLE PAGE

Source Information	
Plant Name	Cricket Valley Energy Center
Sampling Location	U-00003 Base+DB
Fuel Type	Gas, Natural

Test Information			
Project #		bec-19-cricketvalley.ny-start#3	
Operator		GT	
Date for Preliminary Run	(mm/dd/yy)	04/16/20	
Standard Temperature		68	°F
Standard Pressure		29.92	in Hg
Required Sample Vol.	10 L/min	10.6	scf
Run Duration	8a, 2.4.1.3	120	minutes
Unit Number		U-00003	
Base Run Number		SAM U-00003 Base+DB	
Number of Ports Available		4	
Number of Ports Used		1	
Port Inside Diameter		6.00	in
Stack Shape		Circular

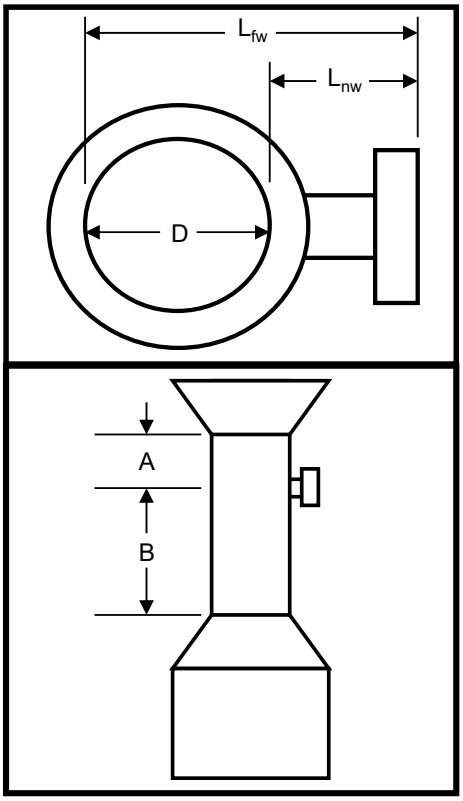
Testing Company Information	
Company Name	Air Hygiene International, Inc. (Tulsa, Oklahoma)
Address	1600 W Tacoma Street
City, State Zip	Broken Arrow, Oklahoma 74012
Project Manager	Rob White
Phone Number	(918) 307-8865
Fax Number	(918) 307-9131



Created with Isocalc-AHI v20190830

METHOD 1 - SAMPLE AND VELOCITY TRAVERSES FOR CIRCULAR SOURCES

Plant Name	Cricket Valley Energy Center	**Date**	04/16/20
Sampling Location	U-00003 Base+DB	**Stack Type**	Circular
Operator	GT	**Ports Available**	4
Project #	bec-19-cricketvalley.ny-start#3	**Ports Used**	1
Stack Size	Large (>24 inch diameter)	**Port ID (inches)**	6.00

Circular Stack or Duct Diameter			
Distance to Far Wall of Stack	(L_{fw})	236.00	in
Distance to Near Wall of Stack	(L_{nw})	8.00	in
Diameter of Stack	(D)	228.00	in
Area of Stack	(A_s)	283.53	ft²

Distance from Port to Disturbances			
Distance Upstream	(A)	200.40	in
Diameters Upstream	(A_D)	0.88	diameters
Distance Downstream	(B)	850.00	in
Diameters Downstream	(B_D)	3.73	diameters

Number of Traverse Points Required			
Diameters to Flow Disturbance		**Minimum Number of[1] Traverse Points**	
Down Stream	**Up Stream**	**Particulate Points**	**Velocity Points**
2.00-4.99	0.50-1.24	24	16
5.00-5.99	1.25-1.49	20	16
6.00-6.99	1.50-1.74	16	12
7.00-7.99	1.75-1.99	12	12
>= 8.00	>=2.00	8 or 12[2]	8 or 12[2]
Upstream Spec		24	16
Downstream Spec		24	16
Traverse Pts Required		24	16

[1] Check Minimum Number of Points for the Upstream and Downstream conditions, then use the largest.

[2] 8 for Circular Stacks 12 to 24 inches
12 for Circular Stacks over 24 inches

◉ Method 1 Trav

CERTIFICATE OF ANALYSIS
(Zero Ambient Nitrogen)

Cylinder Number:	EB0058639	**Certification Date:**	02/25/2020
Product ID Number:	121026	**Expiration Date:**	02/23/2028
Cylinder Pressure:	1900 PSIG	**MFG Facility:**	RBTGS-Shreveport-LA
COA #	EB0058639.20200225-0	**Lot Number:**	EB0058639.20200225
Customer PO. NO.:		**Tracking Number:**	074332593
Customer:		**Previous Certification Dates:**	

This mixture is for laboratory use only, not for drug, household or other use.
This mixture is certified in Mole % to be within ±2% of the actual number reported with a confidence of 95%.
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

Composing Material: Zero Ambient Nitrogen, Cert., Sz152

Component	Specification	Concentration
Nitrogen	Balance	Balance
Oxygen as Impurity	<1.0 PPM	<1.0 PPM
Carbon Dioxide as Impurity	<0.5 PPM	<0.5 PPM
Carbon Monoxide as Impurity	<0.5 PPM	<0.5 PPM
Total Oxides of Nitrogen as Impurity	<0.1 PPM	<0.1 PPM
Sulfur Dioxide as Impurity	<0.1 PPM	<0.1 PPM
Total Hydrocarbons as Impurity	<0.1 PPM	<0.1 PPM

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

APPENDIX D

QUALITY ASSURANCE AND QUALITY CONTROL DATA

QA/QC PROGRAM

AIR HYGIENE ensures the quality and validity of its emission measurement and reporting procedures through a rigorous quality assurance (QA) program. The program is developed and administered by an internal QA team and encompasses six major areas:

1. Field Qualifications
2. QA reviews of reports, laboratory work, and field testing;
3. Equipment calibration and maintenance;
4. Chain-of-custody;
5. Training; and
6. Knowledge of current test methods

Field Qualifications

Air Hygiene personnel are required to gain and maintain competence with testing methods and techniques according to their job titles and the roles they play during field testing events. Qualifications for each job description include:

Staff Technician - An entry level position with responsibility to test on the stack by performing duties that include: keep trucks and trailers stocked and clean, travel to and from job site, be the "hands of the test" on the stack; stay on a stack during the sample test, set up and tear down equipment on-site, perform maintenance on equipment in the shop and on-site.

Test Technician or Specialist - Acts as the "hands of the test" on the stack by performing duties that include: stay on a stack during the sample test, migrate to the testing trailer and learn the different analyzers and testing methods used on site, set up and tear down testing equipment on site, learn the system for testing from Testing Managers and Project Managers, travel to and from job site; including driving responsibilities under DOT requirements, follow directions of Testing Managers and Project Managers, learn the proper way to conduct on-site test of stationary stacks

Test Manager or Engineer - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Test Managers must hold at least one QSTI certificate.

Project Manager - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Project Managers typically hold QSTI certificates in Groups 1 through 4.

QA Reviews

Air Hygiene's review procedure includes review of each source test report, along with laboratory and fieldwork, by the QA Team. The most important review is the one that takes place before a test program begins. The QA Team works closely with technical division personnel to prepare and review test protocols. Test protocol review includes selection of appropriate test procedures, evaluation of interferences or other restrictions that might preclude use of standard test procedures, and evaluation and/or development of alternate procedures.

Equipment Calibration and Maintenance

The equipment used to conduct the emission measurements is maintained according to the manufacturer's instructions to ensure proper operation. In addition to the maintenance program, calibrations are carried out on each measurement device according to the schedule outlined by the Environmental Protection Agency. Quality control checks are also conducted in the field for each test program. In conformance with ASTM D7036 Section 15.3.15, all metering and monitoring equipment meets or exceeds the uncertainty criteria contained in the method language that pertains to that equipment.

Chain-of-Custody

Air Hygiene maintains full chain-of-custody documentation on all samples and data sheets. In addition to normal documentation of changes between field sample custodians, laboratory personnel, and field test personnel, Air Hygiene documents every individual who handles any test component in the field (e.g., probe wash, impinger loading and recovery, filter loading and recovery, etc.). Samples are stored in a locked area to which only Air Hygiene personnel have access. Field data sheets are secured at Air Hygiene's offices upon return from the field.

Training

Personnel's training is essential to ensure quality testing. Air Hygiene has formal and informal training programs, which include:

1. Attendance at EPA-sponsored training courses
2. Enrollment in EPA correspondence courses
3 A requirement for all technicians to read and understand Air Hygiene's QA manual
4. In-house training and QA meetings on a regular basis
5. Maintenance of training records

Knowledge of Current Test Methods

With the constant updating of standard test methods and the wide variety of emerging test procedures, it is essential that any qualified source tester keep abreast of new developments. Air Hygiene subscribes to services, which provide updates on EPA reference methods, rules, and regulations. Additionally, source test personnel regularly attend and present papers at testing and emission-related seminars and conferences. Air Hygiene personnel maintain membership in the Air and Waste Management Association and the American Industrial Hygiene Association.

Reproduction and Distribution Policy

Reproducing portions of this test report may omit critical or substantial documentation or be taken out of context and due care must be exercised in this regard. Furthermore, this test report and its associated data shall not be reproduced in full or in part without the written consent of the customer.

Data Provided by Client

Data provided by the Client is clearly identified in the report. Air Hygiene accepts data provided by the Client as accurate.

COMBUSTION TESTING QUALITY ASSURANCE ACTIVITIES

In conformance with ASTM D7036 Section 15.3.11 and 13, all testing was performed without any real or apparent errors, with the exception of those that would be listed in Section 2.0 of this report. In addition, all testing was conducted according to the approved testing protocol, test methods, Air Hygiene Quality Manual, or ASTM D7036, with the exception of specifics noted in Section 2.0 of this report. A number of quality assurance activities were undertaken before, during, and after this testing project. This section of the report combined with the documentation in Appendix C describes each of those activities.

Each instrument's response was checked and adjusted in the field prior to the collection of data via multi-point calibration. The instrument's linearity was checked by adjusting its zero and span responses to zero nitrogen and an upscale calibration gas in the range of the expected concentrations. The instrument response was then challenged with other calibration gases of known concentration and accepted as being linear if the response of the other calibration gases agreed within plus or minus two percent of the range of predicted values. NO_2 to NO conversion was checked via direct connect with an EPA Protocol certified concentration of NO_2 in a balance of air or nitrogen. Conversion was verified to be between 90 and 110 percent.

After each test run, the analyzers were checked for zero and span drift. This allowed each test run to be bracketed by calibrations and documents the precision of the data just collected. The criterion for acceptable data is that the instrument drift is no more than three percent of the full-scale response. The quality assurance worksheets in the following pages summarize all multipoint calibration checks and zero to span checks performed during the tests. These worksheets (as prepared from the data records of Appendix A) show that no drifts in excess of three percent occurred in the zero to span checks following each test run.

The sampling systems were leak checked by demonstrating that a vacuum greater than 10 in Hg could be held for at least one minute with a decline of less than one inch of Hg. A leak test was conducted after the sample system was set up and before the system was dismantled. This test was conducted to ensure that ambient air had not diluted the sample. Any leakage detected prior to the tests would be repaired and another leak check conducted before testing commenced. No leaks were found during the pre or post-test leak checks.

The absence of leaks in the sampling system was also verified by a sampling system bias check. The sampling system's integrity was tested by comparing the responses of the analyzers to the calibration gases introduced via two paths. The first path was directly into the analyzer and the second path via the sample system at the sample probe. Any difference in the instrument responses by these two methods was attributed to sampling system bias or leakage. The criterion for acceptance is agreement within five percent of the span of the analyzer.

The control gases used to calibrate the instruments were analyzed and certified by the compressed gas vendors to plus or minus one percent accuracy for all gases. EPA Protocol No. 1 was used, where applicable to assign the concentration values traceable to the National Institute of Standards and Technology (NIST), Standard Reference Materials (SRM's). The gas calibration sheets as prepared by the vendor are contained in Appendix C.

Air Hygiene collected and reported the enclosed test data in accordance with the procedures and quality assurance activities described in this test report. Air Hygiene makes no warranty as to the suitability of the test methods. Air Hygiene also assumes no liability relating to the interpretation and use of the test data.

Accredited Laboratory

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

Broken Arrow, OK

for technical competence in the field of

Environmental Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 *General requirements for the competence of testing and calibration laboratories*. This laboratory also meets the A2LA *R219 – Specific Requirements – TNI Field Sampling and Measurement Organization Accreditation Program*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (*refer to joint ISO-ILAC-IAF Communiqué dated April 2017*).

Presented this 18th day of December 2019

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.01
Valid to August 31, 2021

For the tests to which this accreditation applies, please refer to the laboratory's Envrionmental Scope of Accreditation.

STAC STACK TESTING ACCREDITATION COUNCIL

A2LA American Association for Laboratory Accreditation

Accredited Air Emission Testing Body

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

In recognition of the successful completion of the joint A2LA and Stack Testing Accreditation Council (STAC) evaluation process, this laboratory is accredited to perform testing activities in compliance with ASTM D7036:2004 - Standard Practice for Competence of Air Emission Testing Bodies.

Presented this 18th day of December 2019.

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.02
Valid to August 31, 2021

This accreditation program is not included under the A2LA ILAC Mutual Recognition Arrangement.

SOURCE EVALUATION SOCIETY

Qualified Source Testing Individual

LET IT BE KNOWN THAT

ROBERT C. WHITE, Jr.

HAS SUCCESSFULLY PASSED A COMPREHENSIVE EXAMINATION AND SATISFIED EXPERIENCE REQUIREMENTS IN ACCORDANCE WITH THE GUIDELINES ISSUED BY THE SES QUALIFIED SOURCE TEST INDIVIDUAL REVIEW BOARD FOR

NOx Converter Efficiency

Date: April 15, 2020

Analyzer: inst-nx-0031

RM 7E, (02-27-14), Sections 7.1.4; 8.2.4.1; 12.7; and 13.5 Introduce NO_2 to the analyzer and record the NOx concentration displayed. ... Calculate the converter efficiency using Equation 7E-7. The specification for converter efficiency must be met. ... Air Hygiene also references ALT-0013 for specific NO_2 concentration (40-60 ppm) and EPA Traceability Protocol requirements (±2%).

Audit Gas:	NO_2 Concentration (C_v), ppmvd	**48.70**
Converter Efficiency Calculations:		
	Analyzer Reading, NO Channel, ppmvd	**2.19**
	Analyzer Reading, NOx Channel, ppmvd	**49.10**
	Analyzer Reading, NO_2 Channel ($C_{Dir(NO2)}$), ppmvd	**46.91**
	Converter Efficiency, %	**96.32**

RM 7E, (02-27-14), 13.5 NO_2 to NO Conversion Efficiency Test (as applicable). The NO_2 to NO conversion efficiency, calculated according to Equation 7E-7, must be greater than or equal to 90 percent.

$$Eff_{NO2} = \left(\frac{C_{Dir}}{C_V}\right) \times 100$$

Eq. 7E-7 = $\frac{46.91 \text{ ppmvd}}{48.70 \text{ ppmvd}}$ x 100 = 96.32%

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

GENERAL COMMENTS

Sample MMC512 [M202- U3 BASE W/DB- R1] : ORGANIC EXTRACTION :Light oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC513 [M202- U3 BASE W/DB- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC514 [M202- U3 BASE W/DB- R3] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC515 [M202- U3 BASE- R1] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC516 [M202- U3 BASE- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC517 [M202- U3 BASE- R3] : ORGANIC EXTRACTION : Visual oily extract residue found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Results relate only to the items tested.

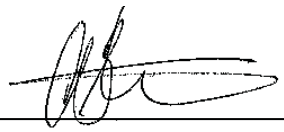
6698432	RSU	RPD - Sample/Sample Dup	Sulphuric Acid Mist	2020/04/27	NC		%	20

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.



Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ann-Marie Stern, Team Lead, Inorganic

Brenda Moore, Team Lead, Inorganic

Frank Mo, B.Sc., Inorganic Lab. Manager

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

GENERAL COMMENTS

Sample MBP535 [M8A/M202- DI WATER BLANK] : INORGANIC EXTRACTION: No residue noted in Teflon dish.

Sample MBP536 [M202- HEXANE BLANK] : ORGANIC EXTRACTION: No residue noted in vial.

Sample MBP537 [M202- ACETONE BLANK] : ORGANIC EXTRACTION: No residue noted in vial.

Sample MBP538 [M202- FB] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP539 [M202- W/DB- R1] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP540 [M202- W/DB- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP541 [M202- W/DB- R3] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP543 [M202- W/ODB- R1] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP544 [M202- W/ODB- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MBP545 [M202- W/ODB- R3] : ORGANIC EXTRACTION : Light oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT

QA/QC Batch	Init	QC Type	Parameter	Date Analyzed	Value	% Recovery	UNITS	QC Limits
6608735	MOR	Spiked Blank	Organic Condensibles	2020/02/28		98	%	70 - 130
6608735	MOR	Method Blank	Organic Condensibles	2020/02/26	<1.0		mg	
6608739	MOR	Method Blank	Inorganic Condensibles	2020/03/02	<0.5		mg	
6608981	MOR	Method Blank	< 2.5 Particulate Weight in Acetone Rinse	2020/02/28	<0.5		mg	
6608984	MOR	Method Blank	2.5 - 10 Particulate Weight in Acetone Rinse	2020/02/28	<0.5		mg	
6608986	MOR	Method Blank	> 10 Particulate Weight in Acetone Rinse	2020/02/28	<0.5		mg	
6613883	RSU	Matrix Spike(MBP785)	Sulphuric Acid Mist	2020/03/02		97	%	80 - 120
6613883	RSU	Spiked Blank	Sulphuric Acid Mist	2020/03/02		99	%	90 - 110
6613883	RSU	Method Blank	Sulphuric Acid Mist	2020/03/02	<0.2		mg	
6613883	RSU	RPD - Sample/Sample Dup	Sulphuric Acid Mist	2020/03/02	NC		%	20

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Bureau Veritas Laboratories 6740 Campobello Road, Mississauga, Ontario, L5N 2L8 Tel: (905) 817-5700 Toll-Free: 800-563-6266 Fax: (905) 817-5777 www.bvlabs.com

Microbiology testing is conducted at 6660 Campobello Rd. Chemistry testing is conducted at 6740 Campobello Rd.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Brenda Moore

Brenda Moore, Team Lead, Inorganic

Frank Mo, B.Sc., Inorganic Lab. Manager

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports.
For Service Group specific validation please refer to the Validation Signature Page.

Bureau Veritas Laboratories 6740 Campobello Road, Mississauga, Ontario, L5N 2L8 Tel: (905) 817-5700 Toll-Free: 800-563-6266 Fax: (905) 817-5777 www.bvlabs.com

Microbiology testing is conducted at 6660 Campobello Rd. Chemistry testing is conducted at 6740 Campobello Rd.

QUALITY ASSURANCE AND QUALITY CONTROL DATA

Supplemental Laboratory Data
BV Labs

Specific data from the lab regarding the filter weights reported at the RDL and noted as “negative weight observed”.

Comparison of actual Lab Reported Filter Loss to the gains in the sample train sections just prior to and just after the filter. The total gains in each of these sections always accounts for the filter loss. Air Hygiene concluded that the frayed filter edges either ended up in the section prior to the filter and/or the section just downstream of the filter.

Data Summary

Run	Filter	Gain in Cyclone End to Front Half of Filter Wash (<2.5) (mg)	Gain in Inorganic Impinger Content (mg)	Sum of Gains (mg)	Lab Reported Filter Loss (mg)
Base – Run 1	19031839	1.6	3.3	4.9	-1.2
Base – Run 3	19031831	1.2	2.2	3.4	-3.1

I hereby certify that to the best of my knowledge all analytical data presented in this report:

- Has been checked for completeness.
- Is accurate, legible and error free.
- Has been conducted in accordance with approved SOP's and that all deviations are clearly listed in the Case Narrative.
- This report has been generated in .pdf format.

Glossary of Terms

- ***MDL*** represents the Minimum Detection Limit below which the laboratory cannot confirm the presence of the analyte to the 95% confidence level.
- ***RDL*** represents the Reportable Detection Limit and is usually set at a value equivalent to the lowest calibration standard
- ***Acceptance Criteria*** are values used by the laboratory to determine that a process is in control.
- ***Accuracy*** is the degree of agreement of a measured value with the true or expected value.
- ***Calibration Standards*** are a set of solutions containing the analytes of interest at a specified concentration.
- ***Calibration Verification Standard*** consists of a calibration standard solution of intermediate concentration (mid-point initial calibration level) used to access whether the initial calibration is still valid
- ***Certified Reference Material*** is a stable homogenous material that is certified by repetitive analysis from a supplier who is certified to generate said materials.
- ***Internal Standard*** a deuterated or ^{13}C-labelled analyte that is added to a sample extract prior to instrumental analysis to compensate for injection variablity.
- ***Isomer*** is a member of a group of compounds that differ from each other only in the locations of a specific number of common substituent atoms or groups of atoms on the parent compound.
- ***Method Blank*** is a laboratory control sample using reagents that are known to be free of contamination.
- ***Precision*** is the degree of agreement between the data generated from repetitive measurements under specific conditions.
- ***Quality Assurance*** is a system of activities whose purpose is to provide the producer or user of a product with the assurance that the product meets a defined standard of quality.
- ***Quality Control*** is the overall system of activities whose purpose is to control the quality of a product so that it meets the needs of the end user.
- ***RSD*** is the relative standard deviation.
- ***Blank Spike*** is a laboratory control sample that has been fortified with native analytes of interest.
- ***Window Defining Mixture*** is a solution containing only the earliest and latest eluting congeners within each homologous group of target analytes on a specified GC column.
- ***RPD*** or Relative Percent Difference. A measure used to compare duplicate sample analysis.
- ***EMPC/NDR –*** Peak detected does not meet ratio criteria and has resulted in a higher detection limit.

Run Date is defined as the date of injection of the last calibration standard (12 hours or less) prior to the samples analyzed within that run sequence. Therefore the time of calibration injection that defines the run date is always within 12 hours of the time of sample injection.

b) Shipping Problems: none encountered

c) Documentation Problems: none encountered

II. SAMPLE PREP:

No problems encountered

III. SAMPLE ANALYSIS:

See also comments within the appropriate Certificate of Analysis

a) Hold Times: all within recommended hold times

b) Instrument Calibration: all within control limits

c) Quality Control: All applicable QC meets control criteria, except where otherwise noted.

d) All analytes requiring manual intergration(s) are noted on the sample chromatograms

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for other than the conditions detailed above.

In addition, I certify, that to the best of my knowledge and belief, the data as reported are true and accurate. Release of the data contained in this data package has been authorized by the cognizant laboratory official or his/her designee, as verified by this signature.

Clayton Johnson, Customer Experience Team Lead

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Microbiology testing is conducted at 6660 Campobello Rd. Chemistry testing is conducted at 6740 Campobello Rd.

GENERAL COMMENTS

Sample MMC512 [M202- U3 BASE W/DB- R1] : ORGANIC EXTRACTION :Light oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC513 [M202- U3 BASE W/DB- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC514 [M202- U3 BASE W/DB- R3] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC515 [M202- U3 BASE- R1] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC516 [M202- U3 BASE- R2] : ORGANIC EXTRACTION : Oily material found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Sample MMC517 [M202- U3 BASE- R3] : ORGANIC EXTRACTION : Visual oily extract residue found in vial.
INORGANIC EXTRACTION : Whitish residue found in Teflon dish.

Results relate only to the items tested.

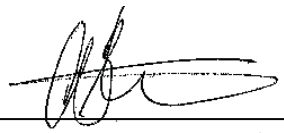
6698432	RSU	RPD - Sample/Sample Dup	Sulphuric Acid Mist	2020/04/27	NC		%	20

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.



Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ann-Marie Stern, Team Lead, Inorganic

Brenda Moore, Team Lead, Inorganic

Frank Mo, B.Sc., Inorganic Lab. Manager

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Internal Data Validation Checklist

Analysis: Anions Run Date: 20200424

Worksheet # (s): 669051, 669057

	Primary review by the analyst - 100 % analysis review	yes	no	n/a
1	Sample analyses meet hold time criteria	✓		
2	Analysis set-up meets method criteria	✓		
3	Tuning and correct calibration used - criteria meets method criteria	✓		
4	SQC/Control Charts updated, analysis in statistical/method control	✓		
5	Internal area counts checked (if applicable)			✓
6	LCS, SRM are within acceptance criteria	✓		
7	Surrogate Recovery(s) is within acceptance criteria			✓
8	Method Blank meets acceptance criteria	✓		
9	Matrix Spike recovery(s) meets acceptance criteria	✓		
10	Duplicate precision meets acceptance criteria	✓		
11	QC is documented on the run logs			✓
12	Runs checked for carryover	✓		
13	Prep log / worksheet(s) are present, signed / dated by a prep / instrument analysts	✓		
14	Initial weights, splits, impringer volumes (where applicable) are documented	✓		
15	Standards and reagents traceable to Certificates of Analysis	✓		
16	Samples above calibration range diluted and reanalyzed			✓
17	Dilution factors (where justified) have been checked for correctness and entered			✓
18	Dilution results compared to original results - Comparison sound			✓
19	Analytical observations/anomalies documented in LIMS			✓
20	Random calculation checked and in correct units	✓		
21	If corrective actions were applied they are documented, initialed & dated			✓
22	Manual integration – before & after data with a reason included, initialed & dated	✓		
24	Transferred data is validated in LIMS for correctness	✓		
25	Data package assembled (where required)			✓

Reviewed by: Ling Li Date: 20200424

Comments:

	Secondary Supervisor/Qualified Data Review Staff	yes	no	n/a
1	Primary Review completed and correct	✓		
2	Repeats documented and referenced			✓
3	Method and sample deviations noted, anomalies described (if applicable)			✓
4	Data and QC validated in LIMS	✓		
5	Random calculation checked	✓		
6	Dilution factors/results have been checked and and compared to original results			✓
7	Worksheet(s) and sample prep sheets (FCDs) signed and dated	✓		
8	Data Package (if required) checked for completeness APR 24 2020			✓

Characteristics of Fuel Gas		
Molecular Weight of gas =	16.634	lb/lb-mole
Btu per lb. of gas[4] =	23,492.652	gross (HHV)
Btu per lb. of gas[4] =	21,172.377	net (LHV)
Density of fuel gas[2] =	0.0432	lb/cu. ft
Wt % VOC in fuel gas =	0.41	%
Specific Gravity[1] =	0.5743	

Component	Wt%
carbon	74.42
oxygen	0.48
hydrogen	24.51
nitrogen	0.60
helium	0.00
sulfur	0.00
Total	**100.00**

F-Factor (SCF dry exhaust per MMBtu [HHV]) = 8,638.02
(Based on EPA RM-19) at 68 deg F and 14.696 psia

F-Factor Calculation:

F-Factor = 1,000,000*((3.64*%H)+(1.53*%C)+(0.57*%S)+(0.14*%N)-(0.46*%O))/GCV

GCV = Gross Btu per lb. of gas (HHV)

%H, %C, %S, %N, & %O are percent weight values calculated from fuel analysis and have units of (scf/lb)/%

Density of natural gas based on specific gravity multiplied by density of air at 68 deg F and 14.696 psia.

Total	**100.00**

F-Factor (SCF dry exhaust per MMBtu [HHV]) = 8,641.42
(Based on EPA RM-19) at 68 deg F and 14.696 psia

F-Factor Calculation:

F-Factor = 1,000,000*((3.64*%H)+(1.53*%C)+(0.57*%S)+(0.14*%N)-(0.46*%O))/GCV

GCV = Gross Btu per lb. of gas (HHV)

%H, %C, %S, %N, & %O are percent weight values calculated from fuel analysis and have units of (scf/lb)/%

Density of natural gas based on specific gravity multiplied by density of air at 68 deg F and 14.696 psia.

Plant Name	Cricket Valley Energy Center	**Project #**	bec-19-cricketvalley.ny-start#3
Equipment	General Electric 7F.05	**# of Ports Available**	4
Location	Dover Plains, New York	**# of Ports Used**	4

Stack Dimensions				**Traverse Data**			
Diameter or Length of Stack	(D)	228.00	in.	4	**Ports by**	3	**Pts / port**
Width of Stack	(W)		in.	12	**Pts Used**	12	**Required**
Area of Stack	(A_s)	283.53	ft^2	**Run Start**	12:29:12	**Run End**	13:35:12

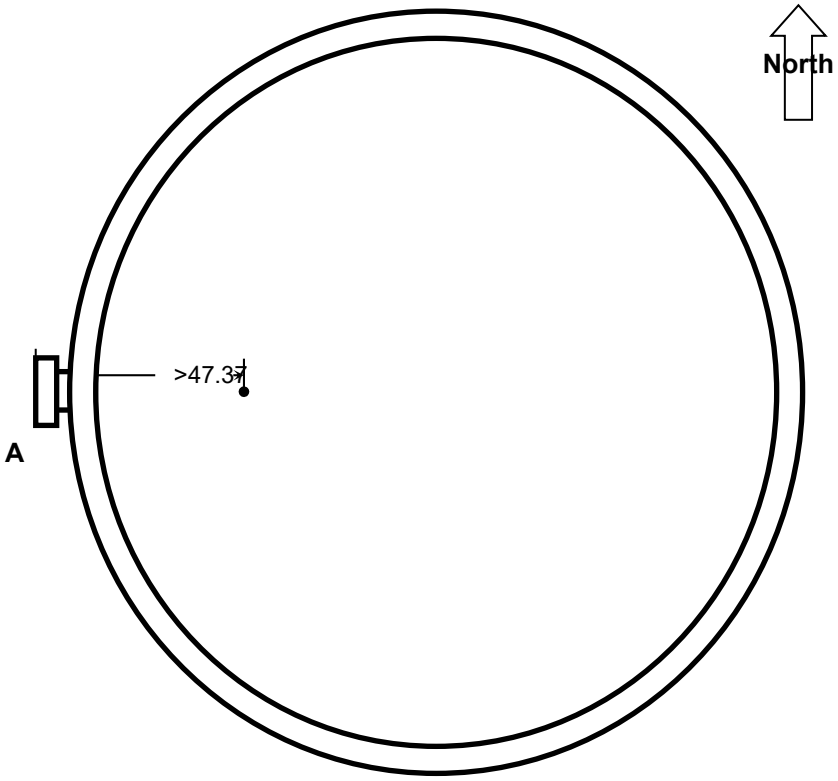
40 CFR 75 Criteria

Stratification Results	
Maximum Percent Difference	4.30 % for NOx
Maximum Pollutant Conc. Diff.	0.10 ppm for NOx
Maximum Diluent Conc. Diff.	0.01 % for O_2
Stratification Conclusions	
Comparison	all diluents/pollutants
Stack Diameter	D > 93.6 in.



Under Part 75 criteria all measured pollutants and diluents demonstrate a non-stratified stack with subsequent testing from a single point located at least one meter away from the stack wall.

Traverse Point Number	**Percent of Stack Diameter**	**Distance from Inside Wall**	**Distance Including Reference Length**
	%	in.	in.
1	>17.27%	>39.37	>47.37

Standard for Calibration of Console Thermocouple Systems

40 CFR, Part 60
Appendix A, Method 5
10.3.2 The temperature data recorded in the field shall be considered valid. If, during calibration, the absolute temperature measured with the sensor being calibrated and the reference sensor **agree within 1.5 percent**, the temperature data taken in the field shall be considered valid.

Standard for Calibration of Individual Thermocouples

EMC, ALT-011: After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer (either ASTM reference thermometer or a thermometer that has been calibrated against an ASTM reference thermometer). The temperatures of the thermocouple and reference thermometers shall **agree to within ±2°F**.

Check the continuity of the thermocouple by subjecting it to a change in the temperature (e.g.., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections (noted by a wrong change in the temperature).

Standard for Calibration of Console Thermocouple Systems

40 CFR, Part 60
Appendix A, Method 5
10.3.2 The temperature data recorded in the field shall be considered valid. If, during calibration, the absolute temperature measured with the sensor being calibrated and the reference sensor **agree within 1.5 percent**, the temperature data taken in the field shall be considered valid.

Standard for Calibration of Individual Thermocouples

EMC, ALT-011: After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer (either ASTM reference thermometer or a thermometer that has been calibrated against an ASTM reference thermometer). The temperatures of the thermocouple and reference thermometers shall **agree to within ±2°F**.

Check the continuity of the thermocouple by subjecting it to a change in the temperature (e.g.., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections (noted by a wrong change in the temperature).

EPA Method 4 - Section 10.3, EPA Method 5 - Section 10.7, EPA Method 202 - Section 10.3: Field Balance Calibration Check. Check the calibration of the balance used to weigh impingers with a weight that is at least 500g or within 50g of a loaded impinger. The weight must be ASTM E617-13 "Standard Specification for Laboratory Weights and Precision Mass Standards" Class 6 (or better). Daily before used, the field balance must meausure within ±0.5g of the certified mass. If the daily balance calibration check fails, perform corrective measures and repeat the check before using balance.

ISO 17025 Certified 500g Weight is certified annually. Certified weight is used to verify Class 6 or better weight that accompanies each field balance on the balance it will be used. Acceptance critieria is certified weight must be within ±0.5g of Class 6 or better weight.

1. INTRODUCTION

Cricket Valley Energy Center is a facility located in Dover Plains, New York. The facility consists of three natural gas-fired combined cycle electric generating units identified as U-00001 (U001), U-00002 (U002), and U-00003 (U003) . In addition to the air emitting equipment, the Facility will include three steam turbine generators (STGs), an air cooled condenser (ACC) and associated auxiliary equipment and systems. This certification report pertains to the U-00001 which consists of a General Electric (GE) Model 7FA.05 combustion turbine generators (CTGs) operating in combined-cycle mode with supplemental firing of the heat recovery steam generators (HRSGs) which has a nominal generating capacity of 333 MW. The maximum potential when incorporated with the steam turbine generator megawatts as per 40 CFR 75 is 383 MW. Natural gas will be the sole fuel fired in the CTGs and duct burners. Each combined cycle generating unit consisting of the CTG, HRSG and STG will be exhausted through its own stack. In addition, to oxidation catalyst being used to control CO emission, both dry-low NO_X burners (DLNB) and Selective Catalytic Reduction (SCR) are used for NO_X control on each unit. Exhaust gases from the turbines are discharged into the atmosphere through a stack approximately 282.5 feet above grade. A dedicated CEMS will monitor NO_X, CO, NH_3(NO_X) and O_2 emissions and gas fuel flow from each of the three units. This report focuses on the U-00001 CEMS.

Custom Instrumentation Services Corporation of Englewood, Colorado built the Continuous Emission Monitoring System. Data from the CEMS is recorded and stored on a Data Acquisition and Handling System (DAHS).

The CEMS on the U-00001 unit was designed to meet the monitoring and reporting requirements of New York State Department of Environmental Conservation (NYSDEC) Permit No. 3-1326-00275/00009 and the regulatory requirements of 40 CFR 60 (NO_X, NH_3, CO and O_2 analyzers) and 40 CFR 75 (NO_x and O_2 analyzers). This report presents the results of the initial certification tests performed on the NO_x, NO_X/NH_3, CO and O_2 analyzers. The testing was performed in accordance with the requirements of 40 CFR 60, Appendix B, Performance Specification 2, 3; 4a and 40 CFR 75, Appendix A.

In addition, this report provides documentation of the DAHS missing data substitution and formula verification as well as fuel flow meter transmitter accuracy tests and orifice plate primary element visual inspections performed as required by 40 CFR 75 for the initial certification.

Field certification testing on Unit U-00001 occurred between December 30, 2019 and February 6, 2020. The tests conducted under 40 CFR 75 on the NO_x and O_2 CEMS included Relative Accuracy Test Audit (RATA), Bias Check, 7-Day Calibration Error Test, Linearity Check and Cycle Time Test. The tests conducted under 40 CFR 60 on NO_X, NH_3/NO_X, CO and O_2 CEMS included RATA, 7-Day Calibration Drift Test and CO Response Time Test. A summary of the tests performed on each analyzer is provided in Table 1.

Printouts of the tests results and revised monitoring plans for the 40 CFR 75 NO_x and O_2 CEMS from EPA's Emissions Collection and Monitoring Plan System (ECMPS) Software are provided in Appendix 1.

Air Hygiene, International(AHI) of Broken Arrow, Oklahoma conducted the RATAs on the NO_x, NH_3/NO_X, CO and O_2 CEMS. On February 6, 2020 ten (10) 21-minute runs were completed on the unit. The results of the RATAs are summarized in Table 1. As shown, the Relative Accuracy calculations on the analyzers were within the EPA and NYSDEC specifications for all parameters. A detailed description of the RATAs conducted are provided in Section 2.1 and the AHI test reports in Appendix 6.

A bias check evaluation was made on the NO_x lb/mmBtu relative accuracy results as required in 40 CFR 75. The bias adjustment factor for the NO_x monitoring systems (NO_x lb/mmBtu) is provided in Table 1. The bias test results are discussed in Section 2.2. Supporting data is provided in the relative accuracy tables in the AHI RA report in Appendix 6.

The 40 CFR 60 7-day Calibration Drift and 40 CFR 75 7-Day Calibration Error tests for U-00001 CEMS occurred during seven consecutive unit operating days from December 30, 2019 through February 8, 2020. The results of these tests are summarized in Table 1. As shown, the analyzers operated well within the applicable specifications. An explanation of the calibration drift and calibration error tests is provided in Section 2.3 and supporting documentation is provided in Appendix 2 of this report.

Although not required for the initial certification, Online/Offline Calibration Error Demonstration tests were performed on the 40 CFR 75 NO_x and O_2 analyzers on January 24, 2020 to allow the use of offline calibrations to validate the Part 75 data during subsequent normal operation. Information on the Online/Offline calibration error demonstration tests is also provided in Section 2.3 and Appendix 2 of this report.

The U-00001 Linearity Checks were performed on the 40 CFR 75 NO_x and O_2 analyzers on February 4, 2020. The NO_x and O_2 Cycle Time Tests and the CO Response Time tests were performed February 4, 2020. The results of these tests are summarized in Table 1. As shown, the analyzers operated well within EPA specifications for all parameters. An explanation of the linearity check is provided in Section 2.4. Explanations of the cycle time and response time tests are provided in Section 2.5. Audit reports for the linearity checks and supporting documents for the cycle time/response time tests are provided in Appendices 3 and 4, respectively.

The DAHS missing data substitution verification and formula verification tests took place November 2, 2019. The DAHS passed all the tests required by EPA. The DAHS tests are described in Section 3 and supporting documents are provided in Appendix 5. Please note that although not required by 40 CFR 60, DAHS formula verifications are also provided for the CO analyzers.

In summary, based on the results of the initial certification tests performed on the CEMS installed on the U-00001 stacks at the Cricket Valley Energy Center, the CEMSs met the

requirements in 40 CFR 60, Appendix B Performance Specification 2, 3, 4a and 40 CFR 75, Appendix A and are therefore certified to provide accurate and reliable data under these regulations and under the NYSDEC air permit. These CEMS will continue to be calibrated, maintained, and operated following the requirements of 40 CFR 60, Appendix F and 40 CFR 75, Appendix B.

TABLE 1.
SUMMARY OF CEMS CERTIFICATION TESTS RESULTS

	RESULTS	STANDARD	PASS / FAIL
	RELATIVE ACCURACY		
NO_x ppm @ 15% O_2	9.22% RA RM	20% RA RM or 10% ARA	PASS

[3] DRIFT, LINEARITY CTT/RTT RESULTS ARE THE HIGHEST ENCOUNTERED DURING ALL TESTS

2. CEMS CERTIFICATION TESTS

Field tests were performed for the initial CEMS certification in accordance with the requirements of 40 CFR 60, Appendix B and 40 CFR Part 75, Appendix A. The results for all tests were determined from the data collected by the DAHS. The computer printouts for each field test are included in the Appendices.

2.1 RELATIVE ACCURACY TEST AUDIT

Relative accuracy testing was performed on February 6, 2020 by AHI a source testing company that meets the EPA Air Emissions Testing Body (AETB) requirements. Each test run was a minimum of 21 minutes in duration and consisted of sampling for NO_x, NH_3 (NO_X), CO and O_2. The times during which the tests were performed and additional information on stratification test, NO_x converter efficiency check and reference method calibrations are provided in the AHI report in Appendix 6.

The reference methods used by AHI are outlined below:

CONSTITUENT	METHOD
O_2	EPA METHOD 3A
NO_x	EPA METHOD 7E
$NH_3(NO_x)$	EPA METHOD 7E
CO	EPA METHOD 10

As shown in the Relative Accuracy tables in the AHI reports in Appendix 6, relative accuracy is reported as an error and is the sum of the absolute mean value of the differences between the reference method tests and the instrument readings, plus the 95 percent confidence interval of the differences, expressed as a percentage of the mean reference method value or the emission standard. As an alternative, 40 CFR 75 allows low NO_x emitters (less than 0.20 lb/mmBtu) to express relative accuracy as the difference between the average reference method value and the average CEMS value. Performance Specification 4a in 40 CFR 60, Appendix B also allows for CO relative accuracy results to be expressed as a mean difference between the reference method average value and CEMS average value.

The analyzer response was determined from the average of readings taken every minute for the duration of the time the relative accuracy tests were performed. The 1-Minute Data Reports from the CEMS are included in the AHI report.

The NO_x, $NH_3(NO_X)$, CO and O_2. analyzers passed the relative accuracy requirements (as stated in 40 CRF 60, Appendix B 2,3, 4a). In addition, the NO_x diluent systems (NO_x and O_2 analyzers combined) passed the relative accuracy requirements as stated in 40 CRF 75, Appendix A and based on the RATA results, these systems qualify for annual RATA frequency under 40 CFR 75.

2.2 BIAS CHECK

The relative accuracy result for the NO_x diluent systems reported in lb/mmBtu was checked for low bias by determining if the mean difference between the test team's values and the CEMS values was greater than the absolute value of the confidence coefficient. U-00001 NO_x diluent systems exhibited bias. Therefore, the bias adjustment factor (BAF) for the unit was 1.000. In general, the BAF is determined after each RATA test.

2.3 7 DAY CALIBRATION ERROR/DRIFT TEST & ONLINE/OFFLINE DEMONSTRATION TESTS

In general, the U-00001 7-day calibration error/drift tests required by 40 CFR 60 and 40 CFR 75 on the NO_x, NH_3 (NO_X), CO and O_2. analyzers occurred between December 30, 2019 and January 27, 2020. All tests occurred on seven consecutive unit-operating days when the unit was combusting fuel. The NO_x and O_2 calibration gases used for the zero and span calibration error tests meet the requirements of the EPA 40 CFR 75, Appendix A, Protocol Gas Verification Program (PGVP). The certificates of analysis for the cylinders used to meet the requirements of both 40 CFR 60 and 40 CFR 75 drift/calibration error requirements are included in Appendix 8 of this report.

Although not required for the initial certification, this report includes the results of the Online/Offline Calibration Error Demonstration tests that were performed on January 24, 2020. 40 CFR 75 Appendix B §2.1.1.2 allows the use of offline calibrations for the purpose of validating online data if both offline and online calibrations are performed within 26-clock hours and meets the performance specification criteria of 40 CFR 75 Append A, §3.1.

The data from calibrations occurring over seven days and the offline determination occurring within 26-clock hours are summarized in Appendix 2 of this report. As shown, the calibration error/drift for all analyzers were well within EPA requirements as stated in 40 CFR 60, Appendix B and 40 CFR 75, Appendix A. The calibration summary reports are provided in Appendix 2.

2.4 LINEARITY CHECKS

The U-00001 NO_x and O_2 linearity checks were performed on February 4, 2020. To perform the linearity check, the high ranges of the NO_x analyzers and the O_2 analyzers were challenged three times with each of three levels of calibration gas (low, mid and high). The mean difference between the analyzer response and the calibration gas value, as a percentage of the calibration gas value, must be within 5%. Results are also acceptable if the difference between the mean response and the calibration gas value is within 0.5% O_2 or 5 ppm NO_x. The results were well within the requirements of 40 CFR 75, Appendix A.

A summary of the linearity check results are provided in Appendix 3 and the certificates of analysis for the calibration gases used during the checks are provided in Appendix 8. The calibration gases used for the linearity checks met the US EPA PGVP requirements of 40 CFR 75, Appendix A.

2.5 CYCLE TIME & RESPONSE TIME TESTS

The U-00001 cycle time tests were performed on February 4, 2020. To perform the test, the NO_x and O_2 analyzers were challenged with a zero gas and a high level (80 to 100% of span) calibration gas. Both the upscale and down scale response times were determined. As stated in 40 CFR 75, Appendix A, the response time to reach 95% of the gas value must be less than 15 minutes.

40 CFR 75, Appendix A, Section 6.4 specifies that on and after January 1, 2009, the cycle time for each component analyzer of a NO_x diluent system must be recorded separately. It also specifies that for monitors with dual ranges, the test results for each range must be reported separately. Cycle time test results are acceptable for monitoring system certification if none of the cycle times exceed 15 minutes. The down scale and upscale cycle times for the NO_x low range, NO_x high range and O_2 analyzers met this specification.

The U-00001 CO response time tests were performed on February 4, 2020 to meet the requirements of 40 CFR 60. To perform this test, the low range of the CO analyzer was challenged with a zero gas and a high level (50 to 100% of range) calibration gas. Both the upscale and down scale response time averages were determined. As stated in 40 CFR 60, Appendix B, Performance Specification 4A the response time to reach 95% of the gas value must be less than 240 seconds. For the upscale and downscale readings the longer of the two response times is the response time for the analyzer. The response time for the low range of the CO analyzers met this requirement. The gas cylinders used to perform the CO response time tests are provided in Appendix 8.

Audit reports that show the analyzers response in ten second increments are located in Appendix 4. The gas cylinders used to perform the NO_X/O_2 cycle time tests meet the US EPA PGVP requirements of 40 CFR 75, Appendix A and are provided in Appendix 8.

3. DAHS VERIFICATION

A letter from the 40 CFR 75 software vendor (CiSCO CEMS) stating that each of the missing data routines and calculations performed by the DAHS was verified is included in Appendix 5. A formula verification is also included. All variables included in the calculations (bias adjustment factor, fuel inputs) were used. The formula verification spreadsheet and associated printouts are also included in Appendix 5.

4. FUEL FLOWMETER CERTIFICATION TESTS DOCUMENTATION

Documents demonstrating that the fuel flowmeters installed in each combustion turbine and duct burner meet the 2% upper range accuracy specified in 40 CFR 75 Appendix D are provided in Appendix 7. This includes Certificate of Compliance document which references ASME NFC 9M:2006 calibration which demonstrates compliance with 40 CFR 75 Appendix D Section 2.1.5.1 certification criteria.

5. DISCUSSION OF RESULTS

The CEMS and DAHS on the U-00001 combustion turbine generators at the Cricket Valley Energy Center successfully met all the requirements of the EPA as outlined in 40 CFR 60 and 40 CFR 75. An electronic QA certification file in the format specified by EPA Clean Air Markets Division for 40 CFR 75 has been prepared for each unit and will be submitted via ECMPS within 45 days of test completion.

LINEARITY CHECK DOCUMENTATION

Turbine 1 O2 Linearity

Cricket Valley Energy Center

Test Information

Test Date: **2/4/2020**
Test Reason: Initial Certification
Grace Period: No
Aborted: No
Unit online during QA test

Analyzer and Monitor Information

Range: Single Scale
Instrument Span: 25 %O2
Component ID: 120
Manufacturer: TELEDYNE
Model: T802
Serial Number: 128

Run Number	Time	Reference Gas	CEMS Response		Cylinder Information
Low Gas					
1	4:07 PM	6.03	6.01		
2	4:22 PM	6.03	6.02		Allowable Reference Values:
3	4:37 PM	6.03	6.01		5-7.5 %O2 (20-30% of span)
	Mean (%O2)	6.03	6.01		Cylinder ID: EB0049417
	Difference of means (|R-A|) (%O2)	0.0	*Limit 0.5*	*Passed*	Expiration Date: 8/13/2021
					EPA Vendor ID: L12013
	Linearity Error (%)	0.3	*Limit 5.0*	*Passed*	Cylinder contains: CO2,O2,BALN
Mid Gas					
1	4:12 PM	13.46	13.51		
2	4:27 PM	13.46	13.51		Allowable Reference Values:
3	4:42 PM	13.46	13.53		12.5-15 %O2 (50-60% of span)
	Mean (%O2)	13.46	13.52		Cylinder ID: EB0053431
	Difference of means (|R-A|) (%O2)	0.1	*Limit 0.5*	*Passed*	Expiration Date: 6/13/2023
					EPA Vendor ID: G12015
	Linearity Error (%)	0.4	*Limit 5.0*	*Passed*	Cylinder contains: O2,BALN
High Gas					
1	4:17 PM	22.15	22.12		
2	4:32 PM	22.15	22.11		Allowable Reference Values:
3	4:47 PM	22.15	22.13		20-25 %O2 (80-100% of span)
	Mean (%O2)	22.15	22.12		Cylinder ID: ALM010779
	Difference of means (|R-A|) (%O2)	0.0	*Limit 0.5*	*Passed*	Expiration Date: 5/9/2027
					EPA Vendor ID: A12019
	Linearity Error (%)	0.1	*Limit 5.0*	*Passed*	Cylinder contains: O2,BALN

Linearity Error (LE) Determination

*LE (%) = (|R-A| / R) * 100*

R = Reference gas value

A = Mean of actual CEMS responses

APPENDIX 5

DAHS VERIFICATION DOCUMENTATION

CUSTOM INSTRUMENTATION SERVICES CORPORATION

Data Acquisition and Handling System (DAHS) Verification Documentation

CeDAR and Breez75X ECMPS Reporting Software

Developed by:
Custom Instrumentation Services Corporation

EPA Regulations

- 40CFR75 Acid Rain
- 40CFR97 CSAPR NOx and SO_2

This letter serves as notice that the required 40 CFR 75 DAHS (missing data and formula) verification have been conducted and passed.

The attached formula verification document which includes CeDAR printouts demonstrates that the DAHS accurately calculates regulated parameters using raw data. In addition, verification tests have been conducted and passed for all missing data substitution routines for ECMPS reporting according to all applicable regulations and specifications in 40 CFR 75 Appendix D and Subpart D. The attached checklist, as adapted from Section 15 of the Acid Rain Program Policy Manual (revised) for 40CFR75, provides the regulatory description of the data substitution criteria.
These verification tests were conducted using numerous data sets at varying loads and operating conditions as well as various missing data periods as described in each set of tests. The tests were conducted using data sets with known outcomes and criteria and were verified against those outcomes. All missing data substitution procedures have been verified to be accurate and correct. Detailed data sets and documentation and test documentation are provided below

Walt Bastron
President

SO_2 Missing Data Verification Checklist [1]

Initial SO_2 Data Substitution: 75.31

Description	Regulation
Prior to 720 QA hours, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.31(b)(1)
Prior to 720 QA hours, non-QA data is substituted with the MPC if previous QA data does not exist.	75.31(b)(2)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard SO_2 Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period.	75.33(b)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period.	75.33(b)(2)(ii)(B)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period.	75.33(b)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(b)(4)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous SO_2 Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

1 The SO2 missing data verification mentioned here does not apply to Cricket Valley Energy Center

O_2 Missing Data Verification Checklist

Initial O_2 Data Substitution: 75.31

Description	Regulation
Prior to 720 QA hours, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(b) 75.31(b)(1)
Prior to 720 QA hours, non-QA data is substituted with the MPC if previous QA data does not exist.	75.36(b) 75.31(b)(2)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard O2 Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 10th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 10th percentile of the lookback period.	75.36(d) 75.33(b)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 5th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 5th percentile of the lookback period.	75.36(d) 75.33(b)(2)(ii)(B)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the minimum value in the lookback period.	75.36(d) 75.33(b)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.36(d) 75.33(b)(4)
Substitution routines have a maximum lookback period of 26280 hours.	75.36(d) 75.33(a)

Miscellaneous SO_2 Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.31(c)(1)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range.	75.31(c)(2)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges.	75.31(c)(3)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range.	75.33(c)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range.	75.33(c)(2)(ii)(B)

For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range.	75.33(c)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(c)(4)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used.	75.33(c)(5)
If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous NOx Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

Appendix D Fuel Flow Rate Missing Data Verification Checklist

Single Fuel Hours, Load Based: Appendix D

Description	Regulation
Non-QA data is substituted with the average of the lookback period at the corresponding load range when only the same fuel was combusted.	App. D 2.4.2.2.1
Non-QA data is substituted with the average of the lookback period at the next higher available load range when only the same fuel was combusted if no data in the corresponding load range exists.	App. D 2.4.2.2.1
Non-QA data is substituted with the a maximum potential flow rate if no data in the lookback period at the corresponding or higher load range when only the same fuel was combusted exists.	App. D 2.4.2.2.1
Substitution routines have a maximum lookback period of 26280 hours.	App. D 2.4.3

Co-Fired Fuel Hours, Load Based: Appendix D

Description	Regulation
Non-QA data is substituted with the maximum in the lookback period at the corresponding load range when the same fuel is co-fired with another fuel.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Non-QA data is substituted with the maximum in the lookback period at the next higher available load range when the same fuel is co-fired with another fuel.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Non-QA data is substituted with a maximum potential flow rate if no data in the lookback period at the corresponding or higher load range when the same fuel is co-fired with another fuel exists.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Substitution routines have a maximum lookback period of 26280 hours.	App. D 2.4.3

Note: If Maximum Heat Rate is exceeded, manual adjustment of Fuel Flows is allowed so that reported Heat Rate equals the maximum. (App. D 2.4.2.3.4)

Fuel Specific NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.31(c)(1)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range.	75.31(c)(2)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges.	75.31(c)(3)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Fuel Specific NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(i) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(ii)(A) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(ii)(B) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(i) 75.33(c)(8)(i) 75.33(c)(8)(ii)

For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(ii)(A) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(ii)(B) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(3) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a fuel specific MPC.	75.33(c)(4) 75.33(c)(8)(iii)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(5) 75.33(c)(8)(i) 75.33(c)(8)(ii)
If no data in the corresponding or higher load ranges exists in the lookback period, the fuel specific MPC is used.	75.33(c)(6) 75.33(c)(8)(iii)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a) 75.33(c)(8)

Miscellaneous Fuel Specific NO_X Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

Season Specific NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(1) 75.74(c)(7)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(2) 75.74(c)(7)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges. Historical data is separated into season specific pools.	75.31(c)(3) 75.74(c)(7)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Season Specific NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(i) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(A) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(B) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(2)(i) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(2)(ii)(A) 75.34(a)(2) 75.74(c)(7)

For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(2)(ii)(B) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(3) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with an MPC.	75.33(c)(4) 75.74(c)(7)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used. Historical data is separated into season specific pools.	75.33(c)(5) 75.34(a)(2) 75.74(c)(7)
If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6) 75.34(a)(2) 75.74(c)(7)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a) 75.34(a)(2) 75.74(c)(7)

Miscellaneous Season Specific NO_X Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

CO_2 Missing Data Verification Checklist 2

Initial CO_2 Data Substitution: 75.35(b) [75.31]

Description	Regulation
Prior to 720 QA hours, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.31(b)(1)
Prior to 720 QA hours, non-QA data is substituted with the MPC if previous QA data does not exist.	75.31(b)(2)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard CO_2 Data Substitution: 75.35(d) [75.33]

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period.	75.33(b)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period.	75.33(b)(2)(ii)(B)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period.	75.33(b)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(b)(4)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous CO_2 Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

Missing Data Verification Checklist [3]

Initial Stack Flow Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.31(c)(1)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range.	75.31(c)(2)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges.	75.31(c)(3)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard Stack Flow Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range.	75.33(c)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range.	75.33(c)(2)(ii)(B)

For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range.	75.33(c)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(c)(4)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used.	75.33(c)(5)
If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous Stack Flow Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

Initial NOx Data Substitution: 75.31

P/F	Description	Regulation	Test
	Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(1) 75.74(c)(7)	DS1 1/1/99
	Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(2) 75.74(c)(7)	DS2 4/3/99
	Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges. Historical data is separated into season specific pools.	75.31(c)(3) 75.74(c)(7)	DS1 1/31/99
	Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)	DS3 12/30/01

Season Specific NOx Data Substitution: 75.33

P/F	Description	Regulation	Test
	For non-QA data blocks less than or equal to 24 hours with an availability of 95% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(i) 75.34(a)(2) 75.74(c)(7)	DS1 4/20/99
	For non-QA data blocks greater than 24 hours with an availability of 95% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(A) 75.34(a)(2) 75.74(c)(7)	DS1 5/31/99

7841 SOUTH WHEELING COURT • ENGLEWOOD, COLORADO 80112
TEL: (303) 790-1000 FAX (303) 790-7292

	For non-QA data blocks greater than 24 hours with an availability of 95% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(B) 75.34(a)(2) 75.74(c)(7)	DS1 5/31/99
	For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90% and less than 95%, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(2)(i) 75.34(a)(2) 75.74(c)(7)	DS1 6/16/99
	For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90% and less than 95%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(2)(ii)(A) 75.34(a)(2) 75.74(c)(7)	DS1 6/17/99
	For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90% and less than 95%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(2)(ii)(B) 75.34(a)(2) 75.74(c)(7)	DS1 6/17/99
	For non-QA data blocks with an availability greater than or equal to 80% and less than 90%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(3) 75.34(a)(2) 75.74(c)(7)	DS1 6/21/99
	For non-QA data blocks with an availability below 80%, non-QA data is substituted with an MPC.	75.33(c)(4) 75.74(c)(7)	DS1 7/31/99
	If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used. Historical data is separated into season specific pools.	75.33(c)(5) 75.34(a)(2) 75.74(c)(7)	DS1 7/31/99
	If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6) 75.34(a)(2) 75.74(c)(7)	DS1 1/30/00
	Substitution routines have a maximum lookback period of 26280 hours.	75.33(a) 75.34(a)(2) 75.74(c)(7)	DS3 3/31/02

1.0 INTRODUCTION

Air Hygiene International, Inc. (Air Hygiene) has completed the Relative Accuracy Test Audit (RATA) for nitrogen oxides (NOx), carbon monoxide (CO), ammonia (NH_3), and oxygen (O_2) from the exhaust of the General Electric, 7F.05, Unit #U-00001 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. This report details the background, results, process description, and the sampling/analysis methodology of the stack sampling survey conducted on February 6, 2020.

The accumulated data from the RATA provides the figures for evaluating the acceptability of the operation of the on-site continuous emission monitoring system (CEMS) for the monitoring of NOx, CO, NH_3, and O_2 from the General Electric, 7F.05, Unit #U-00001 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York.

1.1 TEST PURPOSE AND OBJECTIVES

The purpose of the test was to perform the initial certification RATA on the CEMS that serves the General Electric, 7F.05, Unit #U-00001 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. Reference method (RM) testing followed the Code of Federal Regulations (CFR), Title 40 (40 CFR), Part 60 (40 CFR 60), Appendix A, Methods 1, 3A, 7E, 10, 19; and 40 CFR 63, Appendix A, Method 320. RM values are compared with the on-site CEMS to document performance as required in the 40 CFR 60, Appendix B, Performance Specifications (PS) and 40 CFR 75 Appendix A and B. All relative accuracies were established on-site and were governed by the following sets of rules:

In accordance with 40 CFR 60, Appendix B, PS 2, Section 13.2, the NOx and NH_3 RATA results are acceptable if the relative accuracy (RA) does not exceed 20.0 percent when average emissions during the test are greater than 50 percent of the emission standard or alternative relative accuracy (ARA) does not exceed 10.0 percent when the average emissions during the test are less than 50 percent of the emission standard. Part 60 further requires that the unit be operating at greater than 50 percent of normal load.

In accordance with 40 CFR 75, Appendix A, Section 3.3.2(a) and (b), the NOx RATA results are acceptable if the relative accuracy (RA) does not exceed 10.0 percent or if during the RATA the average NOx emission rate is less than or equal to 0.200 lb/MMBtu and the average difference between the CEMS and reference method (RM) values does not exceed 0.020 lb/MMBtu. Passing this set of criteria requires the CEMS to be retested after no more than two operating quarters. Alternatively, in accordance with 40 CFR 75, Appendix B, Section 2.3.1.2(a) and (f), and Appendix B, Figure 2, the NOx RATA results are acceptable if the RA does not exceed 7.5 percent or if during the RATA the average NOx emission rate is less than or equal to 0.200 lb/MMBtu and the average difference between the CEMS and RM values does not exceed 0.015 lb/MMBtu. Passing this set of criteria allows the CEMS to be retested after four operating quarters or at least within eight calendar quarters.

In accordance with 40 CFR 60, Appendix B, PS 3, Section 13.2, the O_2 RATA results are acceptable if the relative accuracy (RA) does not exceed 20.0 percent or if the average difference between the CEMS and reference method (RM) values does not exceed plus or minus 1.0 percent of the measured value.

In accordance with 40 CFR 60, Appendix B, PS 4 and 4A, Sections 13.2 of each, the CO relative accuracy (RA) test results are acceptable if the RA does not exceed 10.0 percent, if the average difference between the CEMS and reference method (RM) values plus the 2.5 percent confidence coefficient (2.5%CC) does not exceed 5.0 parts per million (ppm), or if the alternative relative accuracy (ARA) does not exceed 5.0 percent. Part 60 further requires that the unit be operating at greater than 50 percent of normal load.

1.2 SUMMARY OF TEST PROGRAM

The following list details pertinent information related to this specific project:

1.2.1 Participating Organizations
- New York State Department of Environmental Conservation (NYSDEC)
- Cricket Valley Energy Center LLC
- Custom Instrumentation Services Corporation (CiSCO)
- Bechtel
- Air Hygiene

1.2.2 Industry
- Electric Utility / Electric Services

1.2.3 Air Permit and Federal Requirements
- Permit Number: 3-1326-00275/00009
- DEC ID: 3132600275
- 40 CFR 60, Appendix B, Performance Specifications (PS)
- 40 CFR 75, Appendix A and B

1.2.4 Plant Location
- Cricket Valley Energy Center in Dover Plains, New York
  - GPS Coordinates [Latitude 41.67616, Longitude -73.576914]
  - 2241 Route NY 22, Dover Plains, New York 12522
  - Federal Registry System / Facility Registry Service (FRS) No. – 110043333372
  - Source Classification Code (SCC) – 20100209

1.2.5 Equipment Tested
- General Electric, 7F.05, Unit #U-00001
  - NOx Analyzer (TAPI T200M, Serial No. 1012)
  - NH_3 Analyzer (TAPI T200M, Serial No. 1047)
  - CO Analyzer (TAPI T300M, Serial No. 518)
  - O_2 Analyzer (TAPI T803, Serial No. 128)

1.2.6 Emission Points
- Exhaust from the General Electric, 7F.05, Unit #U-00001
- For all gases, one sample point in the exhaust duct from the General Electric, 7F.05, Unit #U-00001, determined after conducting a stratification test

1.2.7 Emission Parameters Measured
- NOx
- CO
- NH_3
- O_2

1.2.8 Date of Emission Test
- February 6, 2020

1.2.9 Federal Certifications

- Stack Testing Accreditation Council AETB Certificate No. 3796.02
- International Standard ISO/IEC 17025:2005 Certificate No. 3796.01

2.0 SUMMARY OF TEST RESULTS

Results from the sampling conducted on Cricket Valley Energy Center LLC's General Electric, 7F.05, Unit #U-00001 located at the Cricket Valley Energy Center on February 6, 2020 are summarized in the following table and relate only to the items tested.

TABLE 2.1
SUMMARY OF GENERAL ELECTRIC, 7F.05, UNIT #U-00001 RATA RESULTS

Pollutant	Units	Criteria			Results	Passed / Test Frequency
		CFR	Specification / Section	Standard		
NOx	ppmvd@15%O_2	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 9.22%	YES / ANNUAL
NOx	lb/hr	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 9.60%	YES / ANNUAL
NOx	lb/MMBtu	Part 75	Appendix A, Section 3.3.2(a),(b) Appendix B, Section 2.3.1.2(a),(f), Figure 2	RA ≤ 10%, or if lb/MMBtu ≤ 0.200, d ≤ ±0.020 lb/MMBtu Annual Incentive RA ≤ 7.5%, or if lb/MMBtu ≤ 0.2, d ≤ ±0.015 lb/MMBtu	RA = 9.34% RM = 0.01 lb/MMBtu d = 0.000 lb/MMBtu BAF=1.000	YES / ANNUAL
O_2	%vd	Part 60	Appendix B, Performance Specification 3, Section 13.2	RA ≤ 20%, or d ≤ ±1.0%	RA = 0.48% d = 0.0 %	YES / ANNUAL
CO	ppmvd@15%O_2	Part 60	Appendix B, Performance Specification 4, 4A, from all Section 13.2	RA ≤ 10%, or d + 2.5% CC ≤ ±5 ppmv, or ARA ≤ 5%	RA = 137.85% |d|+2.5%CC = 0.7 ppm	YES / ANNUAL
CO	lb/hr	Part 60	Appendix B, Performance Specification 4, 4A Section 13.2	RA ≤ 10%, or d + 2.5% CC ≤ ±5 lb/hr, or ARA ≤ 5%	RA = 137.82% |d|+2.5%CC = 0.7 ppm (|d|+2.5%CC = 4.3 lb/hr)	YES / ANNUAL
NH_3	ppmvd@15%O_2	Assumed Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 9.70%	YES / ANNUAL
NH_3	lb/hr	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 10.36%	YES / ANNUAL
Load	MW	Part 60	Appendix B, Performance Specifications	> 50% max load	372.8	WITHIN TOLERANCE
Load	MW	Part 75	Appendix A and B	normal load range	372.8	WITHIN TOLERANCE

Notes: RA = relative accuracy, ARA = alternative relative accuracy, RM = reference method value, d = difference between RM and CEMS value, CC = confidence coefficient, v = velocity, BAF = bias adjustment factor

The RATA passed for all pollutants (NOx, CO, NH_3, and O_2) in all units (ppm@15%O_2, lb/hr, lb/MMBtu, and %) under all 40 CFR 60 and 40 CFR 75 criteria.

Specifically, NOx in units of ppm@15%O_2 and lb/hr, passed 40 CFR 60 criteria with an RA less than 20 percent. NOx in units of lb/MMBtu passed the 40 CFR 75 alternative annual incentive criteria with an emissions rate of less than 0.200 lb/MMBtu and a difference between the RM and CEMS analyzers of less than 0.015 lb/MMBtu. Also the Bias Adjustment Factor test resulted in an adjustment factor equal to 1.0 (no adjustment required). O_2 in units of % passed the 40 CFR 60 criteria with an RA less than 20 percent. CO in units of ppm@15%O_2 and lb/hr passed the 40 CFR 60 alternative criteria with a concentration difference between the RM and CEMS analyzers plus the confidence coefficient of less than 5 ppm and 5 lb/hr respectively. NH_3 in units of ppm@15%O_2 and lb/hr passed the 40 CFR 60 criteria with an RA less than 20 percent.

Unit load was within the 40 CFR 60 required criteria of greater than 50 percent of the maximum load and also fell within the normal load criteria as defined by the plants Quality Control and Monitoring Plan which defined the upper and lower boundary on the unit and the normal and secondary normal load ranges.

The results of all measured pollutant emissions were below the required limits. All testing was performed without any real or apparent errors. All testing was conducted according to the approved testing protocol.

3.0 SOURCE OPERATION

3.1 PROCESS DESCRIPTION

Cricket Valley Energy Center LLC (CVEC) owns and operates the Cricket Valley Energy Center located at 2241 ST RTE 22 in Dover Plains, New York. Located on the Cricket Valley Energy Center are three General Electric (GE) 7F.05 Combustion Turbine Generators (CTGs), designated as U-00001, U-00002, and U-0003, and each unit is equipped with one heat recovery steam generator (HRSG) with supplemental duct firing. Each unit is rated at 381 megawatts (MW). The nominal MW per unit as per the NYSDEC Permit ID 3-1326-00275/00009 is identified as 333 MW.

A single, dedicated dry extraction based continuous emissions monitoring system (CEMS) is installed on each the unit. The CEMS configurations include nitrogen oxide (NOx) analyzers, ammonia (NH_3) analyzers, carbon monoxide (CO) analyzers, diluent gas oxygen (O_2) analyzers, and data acquisition and handling systems (DAHS).

3.2 SAMPLING LOCATION

The CTG stack is vertical, circular, and measures 19 feet (ft) (228 inches) in diameter at the test ports which are approximately 265.8 ft above grade level with an exit elevation of approximately 282.5 ft above grade level. The test ports are located approximately 70.8 ft (850 inches) downstream and approximately 16.7 ft (200.4 inches) upstream from the nearest disturbances. Air Hygiene has field verified the measurable dimensions. Non-field verified dimensions are provided by Cricket Valley Energy Center LLC. All exhaust samples for gaseous emissions were continuously drawn from the exhaust system at the sample ports from a single point determined after conducting a stratification test. During the stratification test three points were traversed from each of the four ports. The probe was allowed to remain at a point for two times the system response time.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

4.1 TEST METHODS

The emission test on the General Electric, 7F.05, Unit #U-00001 at the Cricket Valley Energy Center was performed following United States Environmental Protection Agency (EPA) methods described by the Code of Federal Regulations (CFR). Table 4.1 outlines the specific methods performed on February 6, 2020.

TABLE 4.1
SUMMARY OF SAMPLING METHODS

Pollutant or Parameter	Sampling Method	Analysis Method
Sample Point Location	EPA Method 1	Equal Area Method
Oxygen	EPA Method 3A	Paramagnetic Cell
Nitrogen Oxides	EPA Method 7E	Chemiluminescent Analyzer
Carbon Monoxide	EPA Method 10	Nondispersive Infrared Analyzer
Stack Flow Rate	EPA Method 19	Dry Oxygen F Factor
Ammonia and Moisture	EPA Method 320	Fourier Transform Infrared

4.2 INSTRUMENT CONFIGURATION AND OPERATIONS FOR GAS ANALYSIS

The sampling and analysis procedures used during these tests conform with the methods outlined in the Code of Federal Regulations (CFR), Title 40, Part 60, Appendix A, Methods 1, 3A, 7E, 10, 19; and 40 CFR 63, Appendix A, Method 320.

Figure 4.1 depicts the sample system used for the real-time gas analyzer tests. The gas sample was continuously pulled through the probe and transported, via heat-traced Teflon® tubing, to a heated head pump and into the FTIR then to a stainless steel minimum-contact condenser designed to dry the sample. Transportation of the sample, through Teflon® tubing, continued into the sample manifold within the mobile laboratory / portable analyzer via a stainless steel/Teflon® diaphragm pump. From the manifold, the sample was partitioned to the real-time analyzers through rotameters that controlled the flow rate of the sample.

Figure 4.1 shows that the sample system was also equipped with a separate path through which a calibration gas could be delivered to the probe and back through the entire sampling system. This allowed for convenient performance of system bias checks as required by the testing methods.

All instruments were housed in a climate controlled, trailer-mounted mobile laboratory. Gaseous calibration standards were provided in aluminum cylinders with the concentrations certified by the vendor. EPA Protocol No. 1 was used to determine the cylinder concentrations where applicable (i.e. NOx calibration gases).

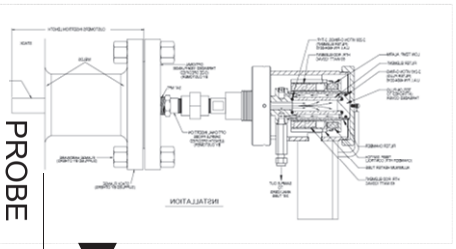
Table 4.2 provides a description of the analyzers used for the instrument portion of the tests. All data from the continuous monitoring instruments were recorded on a Logic Beach Portable Data Logging System which retrieves calibrated electronic data from each instrument every one second and reports an average of the collected data every 30 seconds. For target compounds measured with the Fourier transform infrared (FTIR) spectrometer,

interferograms consisting of 28 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations. Spectral data was analyzed by the MKS MG2000 software.

Ten test runs of approximately 21 minutes each were conducted on the General Electric, 7F.05, Unit #U-00001 for NOx, CO, NH_3, and O_2.

The stack gas analysis for O_2 concentrations was performed in accordance with procedures set forth in EPA Method 3A. The O_2 analyzer uses a paramagnetic cell detector.

EPA Method 7E was used to determine concentrations of NOx. A chemiluminescent analyzer was used to determine the nitrogen oxides concentration in the gas stream. A NO_2 in nitrogen certified gas cylinder was used to verify at least a 90 percent NO_2 conversion on the day of the test.



CO emission concentrations were quantified in accordance with procedures set forth in EPA Method 10. A continuous nondispersive infrared (NDIR) analyzer was used for this purpose.

An MKS Instruments - MultiGas™ Fourier Transform Infrared (FTIR) spectrometer, or equivalent, was used for NH_3 and H_2O analysis per EPA Method 320. The FTIR spectrometer spectral resolution was 0.5 cm^{-1}. The system employed a silicon carbide infrared source at 1200ºC, a helium neon reference laser, beam splitters, potassium bromide (KBr) cell window, front-surface optical transfer mirrors, and multi-pass absorption cells. MCT detectors were used and cooled with liquid nitrogen in order to maintain a constant temperature of 77 Kelvin. The approximately 5.11-meter multi-pass path cells incorporated aspheric, aberration-correcting mirrors to increase the optical throughput and the detection sensitivity. Transducers and thermocouples were connected directly to the insulated sample cells that provide the pressure and temperatures of the sample streams. During testing, the temperature of the absorption cells was set at 191ºC. Elevated temperature prevented gas condensation within the cell and minimized compound adhesion to the cell walls and mirrors. The volume of the absorption cell was 0.5 liters, so at a sample gas flow rate of 4.0 liters per minute, the sample gas in the cell is refreshed approximately four times each minute. Interferograms consisting of 28 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations.

TABLE 4.2
ANALYTICAL INSTRUMENTATION

Parameter	Manufacturer and Model	Range	Sensitivity	Detection Principle
NOx	THERMO 42 series	User may select up to 5,000 ppm	0.1 ppm	Thermal reduction of NO_2 to NO. Chemiluminescence of reaction of NO with O_3. Detection by PMT. Inherently linear for listed ranges.
CO	THERMO 48 series	User may select up to 10,000 ppm	0.1 ppm	Infrared absorption, gas filter correlation detector, microprocessor based linearization.
NH_3 and H_2O	MKS 2030	User may select from multiple ranges	0.1 ppm	Fourier Transform Infrared – FTIR
O_2	SERVOMEX 1440	0-25%	0.1%	Paramagnetic cell, inherently linear.

1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS having span values of 1,000 ppmv CO.
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA or 5 percent when the applicable emission standard (permit limit) is used to calculate RA.

Part 60, Appendix B, Performance Specification 4A,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS that comply with low emission standards (less than 200 ppmv).
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA, 5 percent when the applicable emission standard (permit limit) is used to calculate RA, or within 5 ppmv when the RA is calculated as the absolute average difference between the RM and CEMS plus the 2.5 percent confidence coefficient.

T-value	2.306
Confidence Coefficient	0.0004

Relative Accuracy = 9.34%

If the mean difference is less than or equal to the absolute value of the confidence coefficient, then the Bias Test passes and the bias adjustment factor is not applicable.

Mean Difference =	0.0002
Confidence Coefficient =	0.0004

BAF = 1 + (abs. value mean difference/avg. CEMS reading)

Average CEMS Reading =	0.0064
BAF =	**1.000**

Part 75, Appendix A,
3.3.2 Relative Accuracy for NOX-Diluent Continuous Emission Monitoring Systems
(a) The relative accuracy for NOX-diluent continuous emission monitoring systems shall not exceed 10.0 percent.
(b) For affected units where the average of the reference method measurements of NOX emission rate (this means lb/MMBtu) during the relative accuracy test audit is less than or equal to 0.200 lb/mmBtu, the difference between the mean value of the continuous emission monitoring system measurements and the reference method mean value shall not exceed ±0.020 lb/mmBtu, wherever the relative accuracy specification of 10.0 percent is not achieved.

7.6.5 Bias Adjustment
(b) For single-load RATAs of SO2 pollutant concentration monitors, NOX concentration monitoring systems, and NOX-diluent monitoring systems and for the single-load flow RATAs required or allowed under section 6.5.2 of this appendix and sections 2.3.1.3(b) and 2.3.1.3(c) of Appendix B to this part, the appropriate BAF is determined directly from the RATA results at normal load, using Equation A-12. Notwithstanding, when a NOX concentration CEMS or an SO2 CEMS or a NOX-diluent CEMS installed on a low-emitting affected unit (i.e., average SO2 or NOX concentration during the RATA ≦ 250 ppm or average NOX emission rate ≦ 0.200 lb/mmBtu) meets the normal 10.0 percent relative accuracy specification (as calculated using Equation A-10) or the alternate relative accuracy specification in section 3.3 of this appendix for low-emitters, but fails the bias test, the BAF may either be determined using Equation A-12, or a default BAF of 1.111 may be used.

Part 75, Appendix B,
2.3.1.2 Reduced RATA Frequencies. Relative accuracy test audits of primary and redundant backup SO2 pollutant concentration monitors, CO2 pollutant concentration monitors (including O2 monitors used to determine CO2 emissions), CO2 or O2 diluent monitors used to determine heat input, moisture monitoring systems, NOX concentration monitoring systems, flow monitors, NOX-diluent monitoring systems or SO2-diluent monitoring systems may be performed annually (i.e., once every four successive QA operating quarters, rather than once every two successive QA operating quarters) if any of the following conditions are met for the specific monitoring system involved:
(a) The relative accuracy during the audit of an SO2 or CO2 pollutant concentration monitor (including an O2 pollutant monitor used to measure CO2 using the procedures in appendix F to this part), or of a CO2 or O2 diluent monitor used to determine heat input, or of a NOX concentration monitoring system, or of a NOX-diluent monitoring system, or of an SO2-diluent continuous emissions monitoring system is ≤ 7.5 percent;

(f) For units with low NOX emission rates (average NOX emission rate measured by the reference method during the RATA ≤ 0.200 lb/mmBtu), when a NOX-diluent continuous emission monitoring system fails to achieve a relative accuracy ≤ 7.5 percent, but the monitoring system mean value from the RATA, calculated using Equation A-7 in appendix A to this part, is within ± 0.015 lb/mmBtu of the reference method mean value;

Figure 2 to Appendix B of Part 75_Relative Accuracy Test Frequency Incentive System.

RATA	Semiannual(percent)(1)	Annual(1)
SO2 or NOX(3)	7.5% < RA ≤ 10.0% or ± 15.0 ppm(2)	RA ≤ 7.5% or ± 12.0 ppm(2)
SO2-diluent	7.5% < RA ≤ 10.0% or ± 0.030 lb/mmBtu(2)	RA ≤ 7.5% or ± 0.025 lb/mmBtu(2)
NOX-diluent	7.5% < RA ≤ 10.0% or ± 0.020 lb/mmBtu(2)	RA ≤ 7.5% or ± 0.015 lb/mmBtu(2)
Flow	7.5% < RA ≤ 10.0% or ± 2.0 fps(2)	RA ≤ 7.5% or ± 1.5 fps
CO2 or O2	7.5% < RA ≤ 10.0% or ± 1.0% CO2/O2(2)	RA ≤ 7.5% or ± 0.7% CO2/O2(2)
Moisture	7.5% < RA ≤ 10.0% or ± 1.5% H2O(2)	RA ≤ 7.5% or ± 1.0% H2O(2)

(1) The deadline for the next RATA is the end of the second (if semiannual) or fourth (if annual) successive QA operating quarter following the quarter in which the CEMS was last tested. Exclude calendar quarters with fewer than 168 unit operating hours (or, for common stacks and bypass stacks, exclude quarters with fewer than 168 stack operating hours) in determining the RATA deadline. For SO2 monitors, QA operating quarters in which only very low sulfur fuel as defined in § 72.2, is combusted may also be excluded. However, the exclusion of calendar quarters is limited as follows: the deadline for the next RATA shall be no more than 8 calendar quarters after the quarter in which a RATA was last performed.
(2) The difference between monitor and reference method mean values applies to moisture monitors, CO2, and O2 monitors, low emitters, or low flow, only.
(3) A NOX concentration monitoring system used to determine NOX mass emissions under § 75.71.

Calculations, Formulas, and Constants

The following information supports the spreadsheets for this testing project.

Given Data:

Ideal Gas Conversion Factor = 385.23 SCF/lb-mol at 68 deg F & 14.696 psia

Fuel Heating Value is based upon Air Hygiene's fuel gas calculation sheet. All calculations are based upon a correction to 68 deg F & 14.696 psia

High Heating Values (HHV) are used for the Fuel Heating Value, F-Factor, and Fuel Flow Data per EPA requirements.

ASTM D 3588

Molecular Weight of NOx (lb/lb-mole) =	46.01
Molecular Weight of CO (lb/lb-mole) =	28.00
Molecular Weight of SO_2 (lb/lb-mole) =	64.00
Molecular Weight of THC (propane) (lb/lb-mole) =	44.00
Molecular Weight of VOC (methane) (lb/lb-mole) =	16.00
Molecular Weight of NH_3 (lb/lb-mole) =	17.03
Molecular Weight of HCHO (lb/lb-mole) =	30.03
Molecular Weight of CO_2 (lb/lb-mole) =	44.01

40CFR60, App. A., RM 19, Table 19-1

Conversion Constant for NOx =	0.0000001194351
Conversion Constant for CO =	0.0000000726839
Conversion Constant for SO_2 =	0.0000001661345
Conversion Constant for THC =	0.0000001142175
Conversion Constant for VOC (methane) =	0.0000000415336
Conversion Constant for NH_3 =	0.0000000442074
Conversion Constant for HCHO =	0.0000000779534
Conversion Constant for CO_2 =	0.0000001142434

NOTE: units are lb/ppm*ft^3

Formulas:

1. Corrected Raw Average (C_{Gas}), 40CFR60, App. A, RM 7E, Eq. 7E-5 (08/15/06)

$$C_{Gas} = (C_{Avg} - C_O) \times \left(\frac{C_{MA}}{C_M - C_O} \right)$$

2. Correction to % O_2, 40CFR60, App. A, RM 20, Eq. 20-5 (11/26/02)

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}} \right)$$

3. Correction to % O_2 and ISO Conditions

$$C_{ISO} = C_{Adj} \times \sqrt{\frac{P_r}{P_o}} \times e^{(19 \times (H_O - 0.00633))} \times \left(\frac{288}{T_a} \right)^{1.53}$$

4. Method 19 stack exhaust flow (scfh) [ref. EPA EMC FAQ Method 19]

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000} \right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}} \right)$$

5. Emission Rate in lb/hr

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

6. Emission Rate in tons per year

$$E_{ton/yr} = \frac{E_{lb/hr} \times hr_{year}}{2000}$$

7. Emission Concentration in lb/MMBtu (O_2 based)

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$

8. Emission Concentration in g/hp*hr

$$E_{g/hp \cdot hr} = \frac{E_{lb/hr} \times 453.6}{mw \times 1341.022} or \frac{E_{lb/hr} \times 453.6}{hp}$$

RATA SHEET CALCULATIONS

d = Reference Method Data - CEMS Data

S_d = Standard Deviation

CC = Confident Coefficient

n = number of runs

$t_{0.025}$ = 2.5 percent confidence coefficient T-values

RA = relative accuracy

ARA = alternative relative accuracy

BAF = Bias adjustment factor

n	t	n	t	n	t
2	12.706	7	2.447	12	2.201
3	4.303	8	2.365	13	2.179
4	3.182	9	2.306	14	2.160
5	2.776	10	2.262	15	2.145
6	2.571	11	2.228	16	2.131

1. Difference

$$d = \sum_{i=1}^{n} d_i$$

2. Standard Deviation

$$S_d = \sqrt{\frac{\sum_{i=1}^{n} d_i^2 - \left[\frac{\left(\sum_{i=1}^{n} d_i \right)^2}{n} \right]}{n-1}}$$

3. Confident Coefficient

$$CC = t_{0.025} \times \frac{S_d}{\sqrt{n}}$$

4. Relative Accuracy

$$RA = \frac{|d_{AVG}| + |CC|}{RM_{AVG}} \times 100$$

5. Alternative Relative Accuracy

$$ARA = \frac{|d_{AVG}| + |CC|}{AS} \times 100$$

5. Bias Adjustment Factor

$$BAF = 1 + \left(\frac{|d_{AVG}|}{CEM_{AVG}} \right)$$

RM 7E, (08-15-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

ACE = Analyzer calibration error, percent of calibration span.
B_{WS} = Moisture content of sample gas as measured by Method 4 or other approved method, percent/100.
C_{Avg} = Average unadjusted gas concentration indicated by data recorder for the test run.
C_D = Pollutant concentration adjusted to dry conditions.
C_{Dir} = Measured concentration of a calibration gas (low, mid, or high) when introduced in direct calibration mode.
C_{Gas} = Average effluent gas concentration adjusted for bias.
C_M = Average of initial and final system calibration bias (or 2-point system calibration error) check responses for the upscale calibration gas.
C_{MA} = Actual concentration of the upscale calibration gas, ppmv.
C_O = Average of the initial and final system calibration bias (or 2-point system calibration error) check responses from the low-level (or zero) calibration gas.
C_S = Measured concentration of a calibration gas (low, mid, or high) when introduced in system calibration mode.
C_{SS} = Concentration of NOx measured in the spiked sample.
C_{Spike} = Concentration of NOx in the undiluted spike gas.
C_{Calc} = Calculated concentration of NOx in the spike gas diluted in the sample.
C_V = Manufacturer certified concentration of a calibration gas (low, mid, or high).
C_W = Pollutant concentration measured under moist sample conditions, wet basis.
CS = Calibration span.
D = Drift assessment, percent of calibration span.
E_p = The predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response.
Eff_{NO2} = NO_2 to NO converter efficiency, percent.
H = High calibration gas, designator.
L = Low calibration gas, designator.
M = Mid calibration gas, designator.
NOFinal = The average NO concentration observed with the analyzer in the NO mode during the converter efficiency test in Section 16.2.2.
NOxCorr = The NOx concentration corrected for the converter efficiency.
NOxFinal = The final NOx concentration observed during the converter efficiency test in Section 16.2.2.
NOxPeak = The highest NOx concentration observed during the converter efficiency test in Section 16.2.2.
Q_{Spike} = Flow rate of spike gas introduced in system calibration mode, L/min.
Q_{Total} = Total sample flow rate during the spike test, L/min.
R = Spike recovery, percent.
SB = System bias, percent of calibration span.
SB_i = Pre-run system bias, percent of calibration span.
SB_f = Post-run system bias, percent of calibration span.
SB / D_{Alt} = Alternative absolute difference criteria to pass bias and/or drift checks.
SCE = System calibration error, percent of calibration span.
SCE_i = Pre-run system calibration error, percent of calibration span.
SCE_{final} = Post-run system calibration error, percent of calibration span.
Z = Zero calibration gas, designator.

40CFR60.355(b)(1), (09-20-06), Nomenclature. The terms used in the equations are defined as follows:

P_r = reference combustor inlet absolute pressure at 101.3 kilopascals ambient pressure, mm Hg
P_o = observed combustor inlet absolute pressure at test, mm Hg
H_o = observed humidity of ambient air, g H_2O/g air
e = transcendental constant, 2.718
T_a = ambient temperature, K

Small Engine and FTIR Nomenclature. The terms used in the equations are defined as follows:

bhp = brake horsepower
hp = horsepower
Q_{sys} = system flow (lpm)
Q_m = matrix spike flow (lpm)

RM 19, (07-29-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

AdjFactor = Percent oxygen or carbon dioxide adjustment applied to a target pollutant
B_{wa} = Moisture fraction of ambient air, percent.
Btu = British thermal unit
$\%_C$ = Concentration of carbon from an ultimate analysis of fuel, weight percent.
$\%_{CO2d}$,$\%_{CO2w}$ = Concentration of carbon dioxide on a dry and wet basis, respectively, percent.
CIP / CDP = Combustor inlet pressure / compressor discharge pressure (mm Hg); note, some manufactures reference as PCD.
E = Pollutant emission rate, ng/J (lb/million Btu).
E_a = Average pollutant rate for the specified performance test period, ng/J (lb/million Btu).
E_{ao}, E_{ai} = Average pollutant rate of the control device, outlet and inlet, respectively, for the performance test period, ng/J (lb/million Btu).
E_{bi} = Pollutant rate from the steam generating unit, ng/J (lb/million Btu).
E_{bo} = Pollutant emission rate from the steam generating unit, ng/J (lb/million Btu).
E_{ci} = Pollutant rate in combined effluent, ng/J (lb/million Btu).
E_{co} = Pollutant emission rate in combined effluent, ng/J (lb/million Btu).
E_d = Average pollutant rate for each sampling period (e.g.,24-hr Method 6B sample or 24-hr fuel sample) or for each fuel lot (e.g., amount of fuel bunkered), ng/J (lb/million Btu).
E_{di} = Average inlet SO_2 rate for each sampling period d, ng/J (lb/million Btu).
E_g = Pollutant rate from gas turbine, ng/J (lb/million Btu).
E_{ga} = Daily geometric average pollutant rate, ng/J (lbs/million Btu) or ppm corrected to 7 percent O_2.
E_{jo},E_{ji} = Matched pair hourly arithmetic average pollutant rate, outlet and inlet, respectively, ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
E_h = Hourly average pollutant, ng/J (lb/million Btu).
E_{hj} = Hourly arithmetic average pollutant rate for hour "j," ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
EXP = Natural logarithmic base (2.718) raised to the value enclosed by brackets.
Fc = Ratio of the volume of carbon dioxide produced to the gross calorific value of the fuel from Method 19
F_d, F_w, F_c = Volumes of combustion components per unit of heat content, scm/J (scf/million Btu).
ft^3 = cubic feet
G = ideal gas conversion factor
(385.23 SCF/lb-mol at 68 deg F & 14.696 psia)
GCM = gross Btu per SCF (constant, compound based)
GCV = Gross calorific value of the fuel consistent with the ultimate analysis, kJ/kg (Btu/lb).
GCV_p, GCV_r = Gross calorific value for the product and raw fuel lots, respectively, dry basis, kJ/kg (Btu/lb).
$\%_H$ = Concentration of hydrogen from an ultimate analysis of fuel, weight percent.
H_b = Heat input rate to the steam generating unit from fuels fired in the steam generating unit, J/hr (million Btu/hr).
H_g = Heat input rate to gas turbine from all fuels fired in the gas turbine, J/hr (million Btu/hr).
$\%_{H2O}$ = Concentration of water from an ultimate analysis of fuel, weight percent.
H_r = Total numbers of hours in the performance test period (e.g., 720 hours for 30-day performance test period).
K = volume of combustion component per pound of component (constant)
K = Conversion factor, 10^{-5} (kJ/J)/(%) [10^6 Btu/million Btu].
K_c = (9.57 scm/kg)/% [(1.53 scf/lb)/%].
K_{cc} = (2.0 scm/kg)/% [(0.321 scf/lb)/%].
K_{hd} = (22.7 scm/kg)/% [(3.64 scf/lb)/%].
K_{hw} = (34.74 scm/kg)/% [(5.57 scf/lb)/%].
K_n = (0.86 scm/kg)/% [(0.14 scf/lb)/%].
K_o = (2.85 scm/kg)/% [(0.46 scf/lb)/%].
K_s = (3.54 scm/kg)/% [(0.57 scf/lb)/%].
K_{sulfur} = $2x10^4$ Btu/wt%-MMBtu
K_w = (1.30 scm/kg)/% [(0.21 scf/lb)/%].
lb = pound
ln = Natural log of indicated value.
L_p,L_r = Weight of the product and raw fuel lots, respectively, metric ton (ton).
$\%_N$ = Concentration of nitrogen from an ultimate analysis of fuel, weight percent.
$M_{\%}$ = mole percent
mol = mole
MW = molecular weight (lb/lb-mol)
MW_{AIR} = molecular weight of air (28.9625 lb/lb-mole)[1]
NCM = net Btu per SCF (constant based on compound)
$\%_O$ = Concentration of oxygen from an ultimate analysis of fuel, weight percent.
$\%_{O2d}$, $\%_{O2w}$ = Concentration of oxygen on a dry and wet basis, respectively, percent.
P_B = barometric pressure, in Hg
P_s = Potential SO2 emissions, percent.
$\%_S$ = Sulfur content of as-fired fuel lot, dry basis, weight percent.
S_e = Standard deviation of the hourly average pollutant rates for each performance test period, ng/J (lb/million Btu).
$\%_{Sf}$ = Concentration of sulfur from an ultimate analysis of fuel, weight percent.
S(wt%) = weight percent of sulfur, per lab analysis by appropriate ASTM standard
S_i = Standard deviation of the hourly average inlet pollutant rates for each performance test period, ng/J (lb/million Btu).
S_o = Standard deviation of the hourly average emission rates for each performance test period, ng/J (lb/million Btu).
$\%S_p$, $\%S_r$ = Sulfur content of the product and raw fuel lots respectively, dry basis, weight percent.
SCF = standard cubic feet
SH = specific humidity, pounds of water per pound of air
$t_{0.95}$ = Values shown in Table 19-3 for the indicated number of data points n.
T_{amb} = ambient temperature, °F
W/D Factor = 1.0236 = conv. at 14.696 psia and
68 deg F (ref. Civil Eng. Ref. Manual, 7th Ed.)
X_{CO2}=CO_2 Correction factor, percent.
X_k = Fraction of total heat input from each type of fuel k.

EXAMPLE CALCULATIONS (INFORMATION)

Specific Humidity (RH_{sp})

Note: RHsp (gr/lb) calculated using temperature, relative humidity, and barometric pressure with psychrometric chart, psychrometric calculator, or built in psychrometric algorithm.

$$RH_{sp}(lb/lb) = \left[\left(\frac{gr}{lb}\right) \times \frac{lb}{7000\ gr}\right]$$

RH_{sp}= 26.63 gr / lb x 1 lb / 7000 gr = 0.003805 lb H_2O / lb Air

EXAMPLE CALCULATIONS (CALIBRATION)

Analyzer Calibration Error

RM 7E, (02-27-14), 12.2 Analyzer Calibration Error. For non-dilution systems, use Equation 7E-1 to calculate the analyzer calibration error for the low-, mid-, and high-level calibration gases. (calc for NOx analyzer mid gas, if applicable)

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100$$ Eq. 7E-1

ACE = (4.90 ppm - 4.99 ppm) / 8.90 ppm x 100 = -1.01 %

EXAMPLE CALCULATIONS (BIAS, DRIFT, AND CORRECTED RAW AVERAGE)

System Bias

RM 7E, (02-27-14), 12.3 System Bias. For non-dilution systems, use Equation 7E-2 to calculate the system bias separately for the low-level and upscale calibration gases. (calc for NOx analyzer upscale gas, Run 1 initial bias, if applicable)

$$SB = \left(\frac{C_S - C_{Dir}}{CS}\right) \times 100$$ Eq. 7E-2

SB = (4.82 ppm - 4.90 ppm) / 8.90 ppm x 100 = -0.90 %

Drift Assessment

RM 7E, (02-27-14), 12.5 Drift Assessment. Use Equation 7E-4 to separately calculate the low-level and upscale drift over each test run. (calc for NOx analyzer upscale drift, Run 1, if applicable)

$$D = \left|SB_{final} - SB_t\right|$$ Eq. 7E-4

D = | -1.01 % - -0.90 % | = 0.11 %

Alternative Drift and Bias

RM 7E, (02-27-14), 13.2 / 13.3 System Bias and Drift. Alternatively, the results are acceptable if |Cs – Cdir| is ≤ 0.5 ppmv or if |Cs – Cv| is ≤ 0.5 ppmv (as applicable). (calc for NOx analyzer initial upscale, Run 1, if applicable)

$$SB / D_{Alt} = \left|C_S - C_{Dir}\right|$$ Eq. Section 13.2 and 13.3

SB / D_{Alt} = | 4.82 ppm - 4.90 ppm | = 0.08 ppm

Bias Adjusted Average

RM 7E, (02-27-14), 12.6 Effluent Gas Concentration. For each test run, calculate Cavg, the arithmetic average of all valid NOx concentration values (e.g., 1-minute averages). Then adjust the value of Cavg for bias, using Equation 7E-5b. (calc for NOx analyzer, Run 1, if applicable)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$ Eq. 7E-5b

C_{Gas} = (2.90 ppm - 0.01 ppm) (4.99 ppm / (4.82 ppm - 0.01 ppm)) = 3.01 ppm

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RUNS)

Stack Exhaust Flow (Q_S) - RM19

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000}\right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}}\right)$$

Note: Equation presented in EPA Emission Measurement Center (EMC), Frequently Asked Questions (FAQ) for Method 19

$$Q_S = \frac{8{,}710.00\ SCF}{MMBtu} \times \frac{2{,}593{,}600.00\ SCF}{hr} \times \frac{1{,}050.00\ Btu}{SCF} \times \frac{MMBtu}{10^6\ Btu} \times \left[\frac{20.90\%}{20.9\% - 11.9\ \%}\right] = 54{,}863{,}375.38\ SCFH$$

Moisture Correction

RM 7E, (02-27-14), 12.10 Moisture Correction. Use Equation 7E-10 if your measurements need to be corrected to a dry basis. (calc for NOx analyzer, Run 1, if applicable) Note: Calculations may not match as Run 1 results are typically also bias adjusted

$$C_W = C_D \times (1 - B_{WS})$$

$$C_D = \frac{C_W}{1 - B_{WS}}$$ Eq. 7E-10 $C_D = \frac{2.80\ ppmvw}{1 - 0.07} = 3.01\ ppmvd$ or inversely, $C_W = 3.01\ ppmvd \times \left[1 - 0.07\right] = 2.80\ ppmvw$

Diluent-Corrected Pollutant Concentration, O_2 Based

RM 20, (11-26-02), 7.3.1 Correction of Pollutant Concentration Using O_2 Concentration. Calculate the O_2 corrected pollutant concentration, as follows: (calc for NOx gas, Run 1, if applicable) [now contained in applicable Subpart]

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$ Eq. 20-4 $C_{adj} = 3.01\ ppm \times \left[\frac{20.9\% - 15.00\ \%}{20.9\% - 11.86\ \%}\right] = 1.96\ ppm@15\%O_2$

Emissions Rate (lb/hr)

Calculation for pound per hour emission rate. Calculate, as follows: (calc for NOx gas Run 1, if applicable)

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$ $E_{lb/hr} = \frac{3.01\ ppmvd}{10^6\ ppm/part} \times \frac{54{,}863{,}375\ DSCFH \times 46.01\ lb/lb\text{-}mol}{385.23\ SCF/lb\text{-}mol} = \frac{19.70\ lb}{hr}$

Emissions Rate (lb/MMBtu)

RM 19, (02-27-14), 12.2 Emission Rates of PM, SO_2, and NOx. Select from the following sections the applicable procedure to compute the PM, SO_2, or NOx emission rate (E) in ng/J (lb/million Btu). (calc for NOx gas Run 1, if applicable)

Oxygen Based

12.2.1 Oxygen-Based F Factor, Dry Basis. When measurements are on a dry basis for both O_2 ($\%O_2d$) and pollutant (Cd) concentrations, use the following equation:

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$ Eq. 19-1

$$E_{lb/MMBtu} = \frac{3.01\ ppm \times 8{,}710.00\ SCF/MMBtu \times 0.0000001194\ lb/ppm*ft^3 \times 20.9\%}{20.9\% - 11.86\ \%} = \frac{0.007\ lb}{MMBtu}$$

Conversion Constant

Convc for NOx

$$Conv_c(lb/ppm \cdot ft^3) = \frac{\frac{MW}{G}}{10^6}$$

$$Conv_c = \frac{\frac{46.01\ lb}{lb\text{•}mole} \times \frac{lb\text{•}mole}{385.23\ SCF}}{10^6} = \frac{0.0000001194\ lb}{ppm\text{-}ft^3}$$

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RATA RESULTS)

Difference (d)

40 CFR 75, App A, (12-17-09), 7.3.1 Arithmetic Mean. Calculate the arithmetic mean of the differences, d , of a data set as follows. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$d = \sum_{i=1}^{n} d_i$$ Eq. A-7

d = 0.007 lb/MMBtu - 0.006 lb/MMBtu = 0.000 lb/MMBtu

Standard Deviation

40 CFR 75, App A, (12-17-09), 7.3.2 Standard Deviation. Calculate the standard deviation, Sd, of a data set as follows:
(calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$S_d = \sqrt{\frac{\sum_{i=1}^{n} d_i^2 - \frac{\left[\left(\sum_{i=1}^{n} d_i\right)^2\right]}{n}}{n-1}}$$ Eq. A-8

$$S_d = \sqrt{\frac{0.000 \text{ lb/MMBtu}^2 - \frac{\left[0.003 \text{ lb/MMBtu}\right]^2}{9}}{9 - 1}} = 0.001 \text{ lb/MMBtu}$$

Confidence Coefficient

40 CFR 75, App A, (12-17-09), 7.3.3 Confidence Coefficient. Calculate the confidence coefficient (one-tailed), cc, of a data set as follows. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$CC = t_{0.025} \times \frac{S_d}{\sqrt{n}}$$ Eq. A-9

CC = 2.306 x $\frac{0.001 \text{ lb/MMBtu}}{\sqrt{9}}$ = 0.001 lb/MMBtu

T-Values	n	2	3	4	5	6	7	8	9
	$t_{0.025}$	12.706	4.303	3.182	2.776	2.571	2.447	2.365	2.306

2.5 percent confidence coefficients

Relative Accuracy

40 CFR 75, App A, (12-17-09), 7.3.4 Relative Accuracy. Calculate the relative accuracy of a data set using the following equation. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$RA = \frac{|d_{AVG}| + |CC|}{RM_{AVG}} \times 100$$ Eq. A-10

RA = $\frac{|0.000 \text{ lb/MMBtu}| + |0.001 \text{ lb/MMBtu}|}{0.007 \text{ lb/MMBtu}}$ x 100 = 14.99 %

Bias Adjustment Factor (BAF)

40 CFR 75, App A, (12-17-09), 7.6.5 Bias Adjustment. (a) If the monitor or monitoring system fails to meet the bias test requirement, adjust the value obtained from the monitor using the following equation: (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$BAF = 1 + \left(\frac{|d_{AVG}|}{CEM_{AVG}}\right)$$ Eq. A-12

d_{AVG}= 0.000 < |CC| = 0.001 ⇨ BAF = 1 + $\frac{|\quad| \text{ lb/MMBtu}}{\text{lb/MMBtu}}$ = 1.000 lb/MMBtu

Note: BAF only applies if the mean difference (d) is greater than the absolute value of the confidence coefficient.

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

Relative Accuracy Test Data
CEMS Results (NH_3)
General Electric, 7F.05, Unit #U-00001

Parameter:	Ammonia
Date of Test:	February 6, 2020
Reference Method:	EPA Method 7E
CEMS Analyzer Type:	Dual NOx w/ NH3 conversion
Manufacturer:	TAPI
Model #:	T200M
Serial #:	1047

RUN #	RUN TIME	UNIT LOAD	CONCENTRATIONS		RATES	
		(MW)	(ppmvd)	(ppmvd@15%O_2)	(lb/hr)	(lb/MMBtu)

CERTIFICATE OF ANALYSIS
(Zero Ambient Nitrogen)

Cylinder Number:	CC731563	**Certification Date:**	12/12/2019
Product ID Number:	121026	**Expiration Date:**	12/10/2027
Cylinder Pressure:	1900 PSIG	**MFG Facility:**	RBTGS-Shreveport-LA
COA #	CC731563.20191212-0	**Lot Number:**	CC731563.20191212
Customer PO. NO.:		**Tracking Number:**	098934324
Customer:		**Previous Certification Dates:**	

This mixture is for laboratory use only, not for drug, household or other use.
This mixture is certified in Mole % to be within ±2% of the actual number reported with a confidence of 95%.
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

Composing Material: Zero Ambient Nitrogen, Cert., Sz152

Component	Specification	Concentration
Nitrogen	Balance	Balance
Oxygen as Impurity	<1.0 PPM	<1.0 PPM
Carbon Dioxide as Impurity	<0.5 PPM	<0.5 PPM
Carbon Monoxide as Impurity	<0.5 PPM	<0.5 PPM
Total Oxides of Nitrogen as Impurity	<0.1 PPM	<0.1 PPM
Sulfur Dioxide as Impurity	<0.1 PPM	<0.1 PPM
Total Hydrocarbons as Impurity	<0.1 PPM	<0.1 PPM

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

LaMeka Dennis
Operations Manager
Assay Laboratory: Red Ball TGS
Version 02-G, Revised on 2017-07-02

APPENDIX D

QUALITY ASSURANCE AND QUALITY CONTROL DATA

QA/QC PROGRAM

AIR HYGIENE ensures the quality and validity of its emission measurement and reporting procedures through a rigorous quality assurance (QA) program. The program is developed and administered by an internal QA team and encompasses six major areas:

1. Field Qualifications
2. QA reviews of reports, laboratory work, and field testing;
3. Equipment calibration and maintenance;
4. Chain-of-custody;
5. Training; and
6. Knowledge of current test methods

Field Qualifications

Air Hygiene personnel are required to gain and maintain competence with testing methods and techniques according to their job titles and the roles they play during field testing events. Qualifications for each job description include:

Staff Technician - An entry level position with responsibility to test on the stack by performing duties that include: keep trucks and trailers stocked and clean, travel to and from job site, be the "hands of the test" on the stack; stay on a stack during the sample test, set up and tear down equipment on-site, perform maintenance on equipment in the shop and on-site.

Test Technician or Specialist - Acts as the "hands of the test" on the stack by performing duties that include: stay on a stack during the sample test, migrate to the testing trailer and learn the different analyzers and testing methods used on site, set up and tear down testing equipment on site, learn the system for testing from Testing Managers and Project Managers, travel to and from job site; including driving responsibilities under DOT requirements, follow directions of Testing Managers and Project Managers, learn the proper way to conduct on-site test of stationary stacks

Test Manager or Engineer - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Test Managers must hold at least one QSTI certificate.

Project Manager - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Project Managers typically hold QSTI certificates in Groups 1 through 4.

QA Reviews

Air Hygiene's review procedure includes review of each source test report, along with laboratory and fieldwork, by the QA Team. The most important review is the one that takes place before a test program begins. The QA Team works closely with technical division personnel to prepare and review test protocols. Test protocol review includes selection of appropriate test procedures, evaluation of interferences or other restrictions that might preclude use of standard test procedures, and evaluation and/or development of alternate procedures.

Equipment Calibration and Maintenance

The equipment used to conduct the emission measurements is maintained according to the manufacturer's instructions to ensure proper operation. In addition to the maintenance program, calibrations are carried out on each measurement device according to the schedule outlined by the Environmental Protection Agency. Quality control checks are also conducted in the field for each test program. In conformance with ASTM D7036 Section 15.3.15, all metering and monitoring equipment meets or exceeds the uncertainty criteria contained in the method language that pertains to that equipment.

Chain-of-Custody

Air Hygiene maintains full chain-of-custody documentation on all samples and data sheets. In addition to normal documentation of changes between field sample custodians, laboratory personnel, and field test personnel, Air Hygiene documents every individual who handles any test component in the field (e.g., probe wash, impinger loading and recovery, filter loading and recovery, etc.). Samples are stored in a locked area to which only Air Hygiene personnel have access. Field data sheets are secured at Air Hygiene's offices upon return from the field.

Training

Personnel's training is essential to ensure quality testing. Air Hygiene has formal and informal training programs, which include:

1. Attendance at EPA-sponsored training courses
2. Enrollment in EPA correspondence courses
3 A requirement for all technicians to read and understand Air Hygiene's QA manual
4. In-house training and QA meetings on a regular basis
5. Maintenance of training records

Knowledge of Current Test Methods

With the constant updating of standard test methods and the wide variety of emerging test procedures, it is essential that any qualified source tester keep abreast of new developments. Air Hygiene subscribes to services, which provide updates on EPA reference methods, rules, and regulations. Additionally, source test personnel regularly attend and present papers at testing and emission-related seminars and conferences. Air Hygiene personnel maintain membership in the Air and Waste Management Association and the American Industrial Hygiene Association.

Reproduction and Distribution Policy

Reproducing portions of this test report may omit critical or substantial documentation or be taken out of context and due care must be exercised in this regard. Furthermore, this test report and its associated data shall not be reproduced in full or in part without the written consent of the customer.

Data Provided by Client

Data provided by the Client is clearly identified in the report. Air Hygiene accepts data provided by the Client as accurate.

COMBUSTION TESTING QUALITY ASSURANCE ACTIVITIES

In conformance with ASTM D7036 Section 15.3.11 and 13, all testing was performed without any real or apparent errors, with the exception of those that would be listed in Section 2.0 of this report. In addition, all testing was conducted according to the approved testing protocol, test methods, Air Hygiene Quality Manual, or ASTM D7036, with the exception of specifics noted in Section 2.0 of this report. A number of quality assurance activities were undertaken before, during, and after this testing project. This section of the report combined with the documentation in Appendix C describes each of those activities.

Each instrument's response was checked and adjusted in the field prior to the collection of data via multi-point calibration. The instrument's linearity was checked by adjusting its zero and span responses to zero nitrogen and an upscale calibration gas in the range of the expected concentrations. The instrument response was then challenged with other calibration gases of known concentration and accepted as being linear if the response of the other calibration gases agreed within plus or minus two percent of the range of predicted values. NO_2 to NO conversion was checked via direct connect with an EPA Protocol certified concentration of NO_2 in a balance of air or nitrogen. Conversion was verified to be between 90 and 110 percent.

After each test run, the analyzers were checked for zero and span drift. This allowed each test run to be bracketed by calibrations and documents the precision of the data just collected. The criterion for acceptable data is that the instrument drift is no more than three percent of the full-scale response. The quality assurance worksheets in the following pages summarize all multipoint calibration checks and zero to span checks performed during the tests. These worksheets (as prepared from the data records of Appendix A) show that no drifts in excess of three percent occurred in the zero to span checks following each test run.

The sampling systems were leak checked by demonstrating that a vacuum greater than 10 in Hg could be held for at least one minute with a decline of less than one inch of Hg. A leak test was conducted after the sample system was set up and before the system was dismantled. This test was conducted to ensure that ambient air had not diluted the sample. Any leakage detected prior to the tests would be repaired and another leak check conducted before testing commenced. No leaks were found during the pre or post-test leak checks.

The absence of leaks in the sampling system was also verified by a sampling system bias check. The sampling system's integrity was tested by comparing the responses of the analyzers to the calibration gases introduced via two paths. The first path was directly into the analyzer and the second path via the sample system at the sample probe. Any difference in the instrument responses by these two methods was attributed to sampling system bias or leakage. The criterion for acceptance is agreement within five percent of the span of the analyzer.

The control gases used to calibrate the instruments were analyzed and certified by the compressed gas vendors to plus or minus one percent accuracy for all gases. EPA Protocol No. 1 was used, where applicable to assign the concentration values traceable to the National Institute of Standards and Technology (NIST), Standard Reference Materials (SRM's). The gas calibration sheets as prepared by the vendor are contained in Appendix C.

Air Hygiene collected and reported the enclosed test data in accordance with the procedures and quality assurance activities described in this test report. Air Hygiene makes no warranty as to the suitability of the test methods. Air Hygiene also assumes no liability relating to the interpretation and use of the test data.

Accredited Laboratory

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

Broken Arrow, OK

for technical competence in the field of

Environmental Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 *General requirements for the competence of testing and calibration laboratories*. This laboratory also meets the A2LA *R219 – Specific Requirements – TNI Field Sampling and Measurement Organization Accreditation Program*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (*refer to joint ISO-ILAC-IAF Communiqué dated April 2017*).

Presented this 18th day of December 2019

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.01
Valid to August 31, 2021

For the tests to which this accreditation applies, please refer to the laboratory's Envrionmental Scope of Accreditation.

STAC STACK TESTING ACCREDITATION COUNCIL

A2LA American Association for Laboratory Accreditation

Accredited Air Emission Testing Body

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

In recognition of the successful completion of the joint A2LA and Stack Testing Accreditation Council (STAC) evaluation process, this laboratory is accredited to perform testing activities in compliance with ASTM D7036:2004 - Standard Practice for Competence of Air Emission Testing Bodies.

Presented this 18th day of December 2019.

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.02
Valid to August 31, 2021

This accreditation program is not included under the A2LA ILAC Mutual Recognition Arrangement.

SOURCE EVALUATION SOCIETY

Qualified Source Testing Individual

LET IT BE KNOWN THAT

AARON M. BLUM

HAS SUCCESSFULLY PASSED A COMPREHENSIVE EXAMINATION AND SATISFIED EXPERIENCE REQUIREMENTS IN ACCORDANCE WITH THE GUIDELINES ISSUED BY THE SES QUALIFIED SOURCE TEST INDIVIDUAL REVIEW BOARD FOR

GASEOUS POLLUTANTS INSTRUMENTAL SAMPLING METHODS

ISSUED THIS 31ST DAY OF JANUARY 2019 AND EFFECTIVE UNTIL JANUARY 30TH, 2024

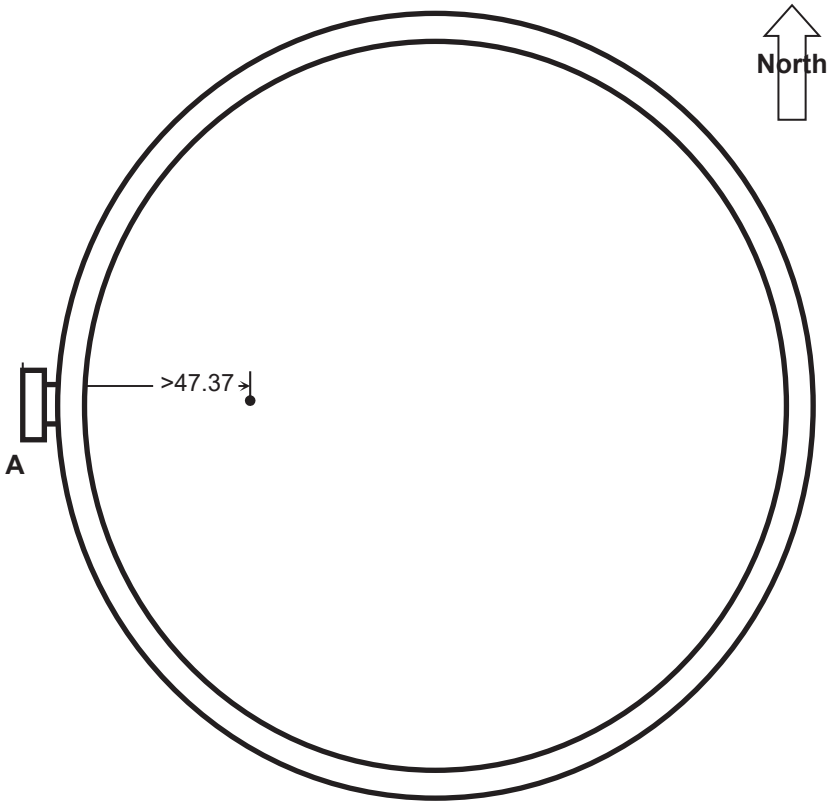
40 CFR 75 Criteria

Stratification Results	
Maximum Percent Difference	0.89 % for O_2
Maximum Pollutant Conc. Diff.	0.22 ppm for NOx
Maximum Diluent Conc. Diff.	0.11 % for O_2

Stratification Conclusions	
Comparison	at least one diluent/pollutant
Stack Diameter	D > 93.6 in.



Under Part 75 criteria at least one measured pollutant or diluent demonstrates a non-stratified stack with subsequent testing from a single point located at least one meter away from the stack wall.

Traverse Point Number	**Percent of Stack Diameter**	**Distance from Inside Wall**	**Distance Including Reference Length**

**Calculated value (4 - 20 mA)

Measured error % o.r.

For detailed data concerning output specifications of the unit under test, see Technical Information (TI), chapter Performance characteristics.

Calibration, traceable to NIST, has been completed on the instruments used in the equipment calibration process (see attached listing).

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approx. 95%. The expanded uncertainty of measurement includes uncertainty components of the reference, the calibration method, the environment and of the device under test. A typical value is used for the uncertainty component of the device

Calibration traceable to NIST has been completed on the instrument listed above by using known working procedures and standards certified by the manufacturers and/or secondary testing laboratories to traceable to NIST. This calibration has been completed using standards having a minimum accuracy of at least four times greater than the instrument listed above. This calibration was conducted in accordance with ISO 17025:2005 and ANSI/NCSL Z540-1. Reported uncertainties represent expanded uncertainties expressed at approximately 95% confidence level using a coverage factor of k=2.

Abnahmeprüfzeugnis nach EN 10204 – 3.1
Inspection certificate acc. to EN 10204 – 3.1

Zeugnis-Nr./Certificate No. US – 3005947899

Es wird bescheinigt, dass die gelieferten Erzeugnisse den Vereinbarungen bei der Bestellung entsprechen. Darüber hinaus wird bescheinigt, dass bei der Herstellung der nachstehend aufgeführten Erzeugnisse die vorgeschriebenen Prüfungen und/oder die zusätzlich aufgeführten Prüfungen nach den bestehenden Prüfvorgaben durchgeführt und die erforderlichen Freigaben erteilt wurden. Die unten aufgeführten Prüfungen wurden durch eine dazu autorisierte Person durchgeführt.

It is certified that the products supplied are in compliance with the requirements of the order. Furthermore, it is confirmed that during the manufacturing of the subsequently listed products the specified inspections and/or the additionally ordered tests have been performed according to the valid procedures and the necessary releases have been given. The subsequently listed inspections have been performed by especially authorized personnel.

Subject: Duct Burner Flow Gas Meter - Statement for CEMS Certification Report
Attachments: RE: CVEC Unit 1 CEMS Certification Report - Bechtel and Owner Comments [*EXTERNAL*]

Reggie:

This statement below from Evan Keiper hopefully satisfies your request regarding the duct burner gas flow meter orifice plate.

This statement and the other email from Evan (attached) regarding the calibration drift matters should satisfy most of your Unit 1 CEMS concerns.

The questions (7 and 8) regarding calibration gases for the linearity tests were not in Evan's purview. I would recommend contacting the CISCO specialist performing the linearity test regarding this information.

Please let me know, if you any additional concerns regarding completion of the Unit 1 CEMS Certification Report.

Regards,

Peter Carr

Subject: RE: Duct Burner Flow Gas Meter - Statement for CEMS Certification Report

Peter,

As the responsible I&C Startup lead on the project, I can attest that the Unit 1 duct burner fuel flow meter including the orifice run was installed correctly onsite and no nonconformances or defects were noted during its initial checkout and placement into operation. Similarly, the orifice plate and transmitter taps were installed per design and are correctly orientated for proper fuel flow measurement. I have also reviewed the AGA calibration records related to the Unit 1 fuel flow meter and noted no issues.

Regards,

Evan Keiper

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

CERTIFICATE OF ANALYSIS

Grade of Product: EPA Protocol

Part Number:	E02NI99E15A2039	Reference Number:	160-401523613-1
Cylinder Number:	CC103280	Cylinder Volume:	144.3 CF
Laboratory:	124 - Plumsteadville - PA	Cylinder Pressure:	2015 PSIG
PGVP Number:	A12019	Valve Outlet:	350
Gas Code:	CO,BALN	Certification Date:	Jun 20, 2019

Expiration Date: Jun 20, 2027

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.
Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty	Assay Dates
CARBON MONOXIDE	7.000 PPM	7.064 PPM	G1	+/- 0.6% NIST Traceable	06/20/2019
NITROGEN	Balance				

CALIBRATION STANDARDS

Type	Lot ID	Cylinder No	Concentration	Uncertainty	Expiration Date
NTRM	061207	KAL003958	9.855 PPM CARBON MONOXIDE/NITROGEN	0.51%	Jun 05, 2024

ANALYTICAL EQUIPMENT

Instrument/Make/Model	Analytical Principle	Last Multipoint Calibration
MKS FTIR - CO - 000928781	FTIR	Jun 07, 2019

CERTIFICATE OF ANALYSIS

Grade of Product: EPA Protocol

Part Number:	E02NI99E15A0131	Reference Number:	122-401524346-1
Cylinder Number:	CC485366	Cylinder Volume:	144.3 CF
Laboratory:	124 - Durham (SAP) - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22019	Valve Outlet:	660
Gas Code:	NO,NOX,BALN	Certification Date:	Jun 24, 2019

Expiration Date: Jun 24, 2022

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty	Assay Dates
NOX	9.000 PPM	8.878 PPM	G1	+/- 0.9% NIST Traceable	06/17/2019, 06/24/2019
NITRIC OXIDE	9.000 PPM	8.849 PPM	G1	+/- 0.9% NIST Traceable	06/17/2019, 06/24/2019
NITROGEN	Balance

1. INTRODUCTION

Cricket Valley Energy Center is a facility located in Dover Plains, New York. The facility consists of three natural gas-fired combined cycle electric generating units identified as U-00001 (U001), U-00002 (U002), and U-00003 (U003) . In addition to the air emitting equipment, the Facility will include three steam turbine generators (STGs), an air cooled condenser (ACC) and associated auxiliary equipment and systems. This certification report pertains to the U-00002 (U002) which consists of a General Electric (GE) Model 7FA.05 combustion turbine generators (CTGs) operating in combined-cycle mode with supplemental firing of the heat recovery steam generators (HRSGs) which has a nominal generating capacity of 333 MW. The maximum potential when incorporated with the steam turbine generator megawatts as per 40 CFR 75 is 383 MW. Natural gas will be the sole fuel fired in the CTGs and duct burners. Each combined cycle generating unit consisting of the CTG, HRSG and STG will be exhausted through its own stack. In addition, to oxidation catalyst being used to control CO emission, both dry-low NO_X burners (DLNB) and Selective Catalytic Reduction (SCR) are used for NO_X control on each unit. Exhaust gases from the turbines are discharged into the atmosphere through a stack approximately 282.5 feet above grade. A dedicated CEMS will monitor NO_X, CO, NH_3(NO_X) and O_2 emissions and gas fuel flow from each of the three units. This report focuses on the U-00002 CEMS.

Custom Instrumentation Services Corporation of Englewood, Colorado built the Continuous Emission Monitoring System. Data from the CEMS is recorded and stored on a Data Acquisition and Handling System (DAHS).

The CEMS on the U-00002 unit was designed to meet the monitoring and reporting requirements of New York State Department of Environmental Conservation (NYSDEC) Permit No. 3-1326-00275/00009 and the regulatory requirements of 40 CFR 60 (NO_X, NH_3, CO and O_2 analyzers) and 40 CFR 75 (NO_x and O_2 analyzers). This report presents the results of the initial certification tests performed on the NO_x, NO_X/NH_3, CO and O_2 analyzers. The testing was performed in accordance with the requirements of 40 CFR 60, Appendix B, Performance Specification 2, 3; 4a and 40 CFR 75, Appendix A.

In addition, this report provides documentation of the DAHS missing data substitution and formula verification as well as fuel flow meter transmitter accuracy tests and orifice plate primary element visual inspections performed as required by 40 CFR 75 for the initial certification.

Field certification testing on Unit U-00002 occurred between January 29, 2020 and February 25, 2020. The tests conducted under 40 CFR 75 on the NO_x and O_2 CEMS included Relative Accuracy Test Audit (RATA), Bias Check, 7-Day Calibration Error Test, Linearity Check and Cycle Time Test. The tests conducted under 40 CFR 60 on NO_X, NH_3/NO_X, CO and O_2 CEMS included RATA, 7-Day Calibration Drift Test and CO Response Time Test. A summary of the tests performed on each analyzer is provided in Table 1.

Printouts of the tests results and revised monitoring plans for the 40 CFR 75 NO_x and O_2 CEMS from EPA's Emissions Collection and Monitoring Plan System (ECMPS) Software are provided in Appendix 1.

Air Hygiene, International(AHI) of Broken Arrow, Oklahoma conducted the RATAs on the NO_x, NH_3/NO_X, CO and O_2 CEMS. On February 25, 2020 eleven (11) 21-minute runs were completed on the unit. The results of the RATAs are summarized in Table 1. As shown, the Relative Accuracy calculations on the analyzers were within the EPA and NYSDEC specifications for all parameters. A detailed description of the RATAs conducted are provided in Section 2.1 and the AHI test report in Appendix 6.

A bias check evaluation was made on the NO_x lb/mmBtu relative accuracy results as required in 40 CFR 75. The bias adjustment factor for the NO_x monitoring systems (NO_x lb/mmBtu) is provided in Table 1. The bias test results are discussed in Section 2.2. Supporting data is provided in the relative accuracy tables in the AHI RA report in Appendix 6.

The 40 CFR 60 7-day Calibration Drift and 40 CFR 75 7-Day Calibration Error tests for U-00002 CEMS occurred during seven consecutive unit operating days from January 29, 2020 through February 6, 2020. The results of these tests are summarized in Table 1. As shown, the analyzers operated well within the applicable specifications. An explanation of the calibration drift and calibration error tests is provided in Section 2.3 and supporting documentation is provided in Appendix 2 of this report.

Although not required for the initial certification, Online/Offline Calibration Error Demonstration tests were performed on the 40 CFR 75 NO_x and O_2 analyzers on February 1, 2020 to allow the use of offline calibrations to validate the Part 75 data during subsequent normal operation. Information on the Online/Offline calibration error demonstration tests is also provided in Section 2.3 and Appendix 2 of this report.

The U-00002 Linearity Checks were performed on the 40 CFR 75 NO_x and O_2 analyzers on February 6, 2020. The NO_x and O_2 Cycle Time Tests and the CO Response Time tests were performed February 6, 2020. The results of these tests are summarized in Table 1. As shown, the analyzers operated well within EPA specifications for all parameters. An explanation of the linearity check is provided in Section 2.4. Explanations of the cycle time and response time tests are provided in Section 2.5. Audit reports for the linearity checks and supporting documents for the cycle time/response time tests are provided in Appendices 3 and 4, respectively.

The DAHS missing data substitution verification and formula verification tests took place January 6, 2020. The DAHS passed all the tests required by EPA. The DAHS tests are described in Section 3 and supporting documents are provided in Appendix 5. Please note that although not required by 40 CFR 60, DAHS formula verifications are also provided for the CO analyzers.

In summary, based on the results of the initial certification tests performed on the CEMS installed on the U-00002 stacks at the Cricket Valley Energy Center, the CEMSs met the

requirements in 40 CFR 60, Appendix B Performance Specification 2, 3, 4a and 40 CFR 75, Appendix A and are therefore certified to provide accurate and reliable data under these regulations and under the NYSDEC air permit. These CEMS will continue to be calibrated, maintained, and operated following the requirements of 40 CFR 60, Appendix F and 40 CFR 75, Appendix B.

TABLE 1.

SUMMARY OF CEMS CERTIFICATION TESTS RESULTS

	RESULTS	STANDARD	PASS / FAIL
	RELATIVE ACCURACY		
NO_x ppm @ 15% O_2	7.84% RA RM	20% RA RM or 10% ARA[1]	PASS

DAHS Computer	Verified (01/06/2020)	Verify	PASS
ANALYZER SERIAL NUMBERS			
NO_x		1013	
O_2		129	
CO		519	
NH_3/NO_X		1048	

[1] ARA = alternative relative accuracy determined from the permit applicable standard.

[2] RATA RESULTS REQUIRED FOR ANNUAL RATA FREQUENCY FOR 40 CFR 75

[3] MD =|d| +|2.5% CC

[4] NYSDEC permit ID 3-1326-00275/00009 does not have a current NH3 lb/hr limit, so a conservative value (16.55 lb/hr) was back-calculated from the existing 5 ppm corrected limit. Calculation is provided in AiR Hygiene RATA report in Appendix 6.

[5] DRIFT, LINEARITY CTT/RTT RESULTS ARE THE HIGHEST ENCOUNTERED DURING ALL TESTS

2. CEMS CERTIFICATION TESTS

Field tests were performed for the initial CEMS certification in accordance with the requirements of 40 CFR 60, Appendix B and 40 CFR Part 75, Appendix A. The results for all tests were determined from the data collected by the DAHS. The computer printouts for each field test are included in the Appendices.

2.1 RELATIVE ACCURACY TEST AUDIT

Relative accuracy testing was performed on February 25, 2020 by AHI a source testing company that meets the EPA Air Emissions Testing Body (AETB) requirements. Each test run was a minimum of 21 minutes in duration and consisted of sampling for NO_x, NH_3 (NO_X), CO and O_2. The times during which the tests were performed and additional information on stratification test, NO_x converter efficiency check and reference method calibrations are provided in the AHI report in Appendix 6.

The reference methods used by AHI are outlined below:

CONSTITUENT	METHOD
O_2	EPA METHOD 3A
NO_x	EPA METHOD 7E
$NH_3(NO_x)$	EPA METHOD 7E
CO	EPA METHOD 10

As shown in the Relative Accuracy tables in the AHI report in Appendix 6, relative accuracy is reported as an error and is the sum of the absolute mean value of the differences between the reference method tests and the instrument readings, plus the 95 percent confidence interval of the differences, expressed as a percentage of the mean reference method value or the emission standard. As an alternative, 40 CFR 75 allows low NO_x emitters (less than 0.20 lb/mmBtu) to express relative accuracy as the difference between the average reference method value and the average CEMS value. Performance Specification 4a in 40 CFR 60, Appendix B also allows for CO relative accuracy results to be expressed as a mean difference between the reference method average value and CEMS average value.

The analyzer response was determined from the average of readings taken every minute for the duration of the time the relative accuracy tests were performed. The 1-Minute Data Reports from the CEMS are included in the AHI report.

The NO_x, $NH_3(NO_X)$, CO and O_2. analyzers passed the relative accuracy requirements (as stated in 40 CRF 60, Appendix B 2,3, 4a). In addition, the NO_x diluent systems (NO_x and O_2 analyzers combined) passed the relative accuracy requirements as stated in 40 CRF 75, Appendix A and based on the RATA results, these systems qualify for annual RATA frequency under 40 CFR 75.

2.2 BIAS CHECK

The relative accuracy result for the NO_x diluent systems reported in lb/mmBtu was checked for low bias by determining if the mean difference between the test team's values and the CEMS values was greater than the absolute value of the confidence coefficient. U-00002 NO_x diluent systems exhibited bias. Therefore, the bias adjustment factor (BAF) for the unit was 1.000. In general, the BAF is determined after each RATA test.

Should have been better stated as "diluent systems met the bias test requirement."

2.3 7 DAY CALIBRATION ERROR/DRIFT TEST & ONLINE/OFFLINE DEMONSTRATION TESTS

In general, the U-00002 7-day calibration error/drift tests required by 40 CFR 60 and 40 CFR 75 on the NO_x, NH_3 (NO_X), CO and O_2. analyzers occurred between January 29, 2020 and February 6, 2020. All tests occurred on seven consecutive unit-operating days when the unit was combusting fuel. The NO_x and O_2 calibration gases used for the zero and span calibration error tests meet the requirements of the EPA 40 CFR 75, Appendix A, Protocol Gas Verification Program (PGVP). The certificates of analysis for the cylinders used to meet the requirements of both 40 CFR 60 and 40 CFR 75 drift/calibration error requirements are included in Appendix 8 of this report.

Although not required for the initial certification, this report includes the results of the Online/Offline Calibration Error Demonstration tests that were performed on February 1, 2020. 40 CFR 75 Appendix B §2.1.1.2 allows the use of offline calibrations for the purpose of validating online data if both offline and online calibrations are performed within 26-clock hours and meets the performance specification criteria of 40 CFR 75 Append A, §3.1.

The data from calibrations occurring over seven days and the offline determination occurring within 26-clock hours are summarized in Appendix 2 of this report. As shown, the calibration error/drift for all analyzers were well within EPA requirements as stated in 40 CFR 60, Appendix B and 40 CFR 75, Appendix A. The calibration summary reports are provided in Appendix 2.

2.4 LINEARITY CHECKS

The U-00002 NO_x and O_2 linearity checks were performed on February 6, 2020. To perform the linearity check, the high ranges of the NO_x analyzers and the O_2 analyzers were challenged three times with each of three levels of calibration gas (low, mid and high). The mean difference between the analyzer response and the calibration gas value, as a percentage of the calibration gas value, must be within 5%. Results are also acceptable if the difference between the mean response and the calibration gas value is within 0.5% O_2 or 5 ppm NO_x. The results were well within the requirements of 40 CFR 75, Appendix A.

A summary of the linearity check results are provided in Appendix 3 and the certificates of analysis for the calibration gases used during the checks are provided in Appendix 8. The calibration gases used for the linearity checks met the US EPA PGVP requirements of 40 CFR 75, Appendix A.

2.5 CYCLE TIME & RESPONSE TIME TESTS

The U-00002 cycle time tests were performed on February 6, 2020. To perform the test, the NO_x and O_2 analyzers were challenged with a zero gas and a high level (80 to 100% of span) calibration gas. Both the upscale and down scale response times were determined. As stated in 40 CFR 75, Appendix A, the response time to reach 95% of the gas value must be less than 15 minutes.

40 CFR 75, Appendix A, Section 6.4 specifies that on and after January 1, 2009, the cycle time for each component analyzer of a NO_x diluent system must be recorded separately. It also specifies that for monitors with dual ranges, the test results for each range must be reported separately. Cycle time test results are acceptable for monitoring system certification if none of the cycle times exceed 15 minutes. The down scale and upscale cycle times for the NO_x low range, NO_x high range and O_2 analyzers met this specification.

The U-00002 CO response time tests were performed on February 6, 2020 to meet the requirements of 40 CFR 60. To perform this test, the low range of the CO analyzer was challenged with a zero gas and a high level (50 to 100% of range) calibration gas. Both the upscale and down scale response time averages were determined. As stated in 40 CFR 60, Appendix B, Performance Specification 4A the response time to reach 95% of the gas value must be less than 240 seconds. For the upscale and downscale readings the longer of the two response times is the response time for the analyzer. The response time for the low range of the CO analyzers met this requirement. The gas cylinders used to perform the CO response time tests are provided in Appendix 8.

Audit reports that show the analyzers response in ten second increments are located in Appendix 4. The gas cylinders used to perform the NO_X/O_2 cycle time tests meet the US EPA PGVP requirements of 40 CFR 75, Appendix A and are provided in Appendix 8.

3. DAHS VERIFICATION

A letter from the 40 CFR 75 software vendor (CiSCO CEMS) stating that each of the missing data routines and calculations performed by the DAHS was verified is included in Appendix 5. A formula verification is also included. All variables included in the calculations (bias adjustment factor, fuel inputs) were used. The formula verification spreadsheet and associated printouts are also included in Appendix 5.

4. FUEL FLOWMETER CERTIFICATION TESTS DOCUMENTATION

Documents demonstrating that the fuel flowmeters installed in each combustion turbine and duct burner meet the 2% upper range accuracy specified in 40 CFR 75 Appendix D are provided in Appendix 7. This includes Certificate of Compliance document which references ASME NFC 9M:2006 calibration which demonstrates compliance with 40 CFR 75 Appendix D Section 2.1.5.1 certification criteria.

Should be: ASME MFC 9M:2006

5. DISCUSSION OF RESULTS

The CEMS and DAHS on the U-00002 combustion turbine generators at the Cricket Valley Energy Center successfully met all the requirements of the EPA as outlined in 40 CFR 60 and 40 CFR 75. An electronic QA certification file in the format specified by EPA Clean Air Markets Division for 40 CFR 75 has been prepared for each unit and will be submitted via ECMPS within 45 days of test completion.

Relative Accuracy Test

System ID:	N20	**System Parameter:**	NOX	**Test Completion:**	02/25/2020 18:17
Test Number:	N20-2020Q1	**Reason for Test:**	INITIAL	**Reported Test Results:**	PASSAPS
# of Op. Levels:	1	**Grace Period Test?**		**EPA Calculated Result:**	PASSAPS
Evaluation Status:	No Errors			**Reported BAF:**	1.000
Submission Status:	Not Submitted			**EPA Calculated BAF:**	1.000
Submission Date:				**RATA Frequency:**	4QTRS

Air Emissions Testing Data

QI Name:	McBRIDE, MICHAEL S	**AETB Name:**	AIR HYGIENE INTERNATIONAL
Exam Date:	01/27/2019	**AETB Phone Number:**	888-461-8778
Provider Name:	SOURCE EVALUATION SOCIETY (SES)	**AETB Email:**	info@airhygiene.com
Provider Email:	QSTIPROGRAM@GMAIL.COM		

Protocol Gas Data:

Gas Level Code	Gas Type Code	Vendor Identifier	Cylinder Identifier	Expiration Date
High	BALN,CO,NO,NOX	G12019	EB0018492	05/02/2022
Mid	BALN,CO,NO,NOX	G12019	EB0065964	07/22/2022
High	BALN,CO2,O2	G12019	CC721614	11/01/2026
Mid	BALN,CO2,O2	G12019	CC722590	06/08/2027
Low	ZERO			

Operating Level: High
Reference Method Used: 7E,3A: NOX RM 7E and CO2/O2 RM 3A

Summary Statistics:

	Reported	Recalculated		Reported	Recalculated
Mean of Monitoring System	0.00617	0.00617	**Relative Accuracy**	7.88	7.88
Mean of Reference Method Values	0.00577	0.00577	**Bias Adjustment Factor**	1.000	1.000
Mean of Difference	-0.00040	-0.00040	**APS Indicator**	Y	Y
Standard Deviation of Difference	0.00007	0.00007	**T-Value**	2.306	2.306
Confidence Coefficient	0.00005	0.00005	**Gross Unit Load or Velocity**	356	356

Facility Name: Cricket Valley Energy Center

Facility ID (ORISPL): 57185

Run Data:

APPENDIX 3

LINEARITY CHECK DOCUMENTATION

Turbine 2 NOx/H Linearity

Cricket Valley Energy Center

Test Information

Test Date: **2/6/2020**
Test Reason:
Grace Period: No
Aborted: No
Unit online during QA test

Analyzer and Monitor Information

Range: High
Instrument Span: 200 ppm
Component ID: 210
Manufacturer: TELEDYNE
Model: T200M
Serial Number: 1013

Run Number	Time	Reference Gas	CEMS Response			Cylinder Information
Low Gas						
1	10:51 AM	51.2	50.2			Allowable Reference Values: 40-60 ppm (20-30% of span)
2	11:04 AM	51.2	50.5			
3	11:16 AM	51.2	50.5			Cylinder ID: AAL073505
	Mean (ppm)	51.2	50.4			Expiration Date: 7/19/2027
	Difference of means (|R-A|) (ppm)	0.8	*Limit 5*	*Passed*		EPA Vendor ID: G12019
	Linearity Error (%)	1.6	*Limit 5.0*	*Passed*		Cylinder contains: CO,NO,NOX,BALN
Mid Gas						
1	10:56 AM	112.4	111.8			Allowable Reference Values: 100-120 ppm (50-60% of span)
2	11:08 AM	112.4	112.1			
3	11:21 AM	112.4	112.1			Cylinder ID: EB0070742
	Mean (ppm)	112.4	112.0			Expiration Date: 12/13/2027
	Difference of means (|R-A|) (ppm)	0.4	*Limit 5*	*Passed*		EPA Vendor ID: B22019
	Linearity Error (%)	0.4	*Limit 5.0*	*Passed*		Cylinder contains: CO,NO,NOX,BALN
High Gas						
1	11:00 AM	177.2	176.1			Allowable Reference Values: 160-200 ppm (80-100% of span)
2	11:12 AM	177.2	176.2			
3	11:25 AM	177.2	175.9			Cylinder ID: SG9160199BAL
	Mean (ppm)	177.2	176.1			Expiration Date: 7/22/2027
	Difference of means (|R-A|) (ppm)	1.1	*Limit 5*	*Passed*		EPA Vendor ID: B22019
	Linearity Error (%)	0.6	*Limit 5.0*	*Passed*		Cylinder contains: CO,NO,NOX,BALN

Linearity Error (LE) Determination

*LE (%) = (|R-A| / R) * 100*

R = Reference gas value

A = Mean of actual CEMS responses

Turbine 2 O2 Linearity

Cricket Valley Energy Center

Test Information

Test Date:	**2/6/2020**
Test Reason:	
Grace Period:	No
Aborted:	No

Unit online during QA test

Analyzer and Monitor Information

Range:	Single Scale
Instrument Span:	25 %O2
Component ID:	220
Manufacturer:	TELEDYNE
Model:	T802
Serial Number:	129

Run Number	Time	Reference Gas	CEMS Response		Cylinder Information
Low Gas					
1	12:32 PM	6.03	6.02		
2	12:47 PM	6.03	6.03		Allowable Reference Values:
3	1:02 PM	6.03	6.03		5-7.5 %O2 (20-30% of span)
	Mean (%O2)	6.03	6.03		Cylinder ID: EB0049417
	Difference of means (|R-A|) (%O2)	0.0	*Limit 0.5*	*Passed*	Expiration Date: 8/13/2021
	Linearity Error (%)	0.1	*Limit 5.0*	*Passed*	EPA Vendor ID: L12013
					Cylinder contains: CO2,O2,BALN
Mid Gas					
1	12:37 PM	13.46	13.52		
2	12:52 PM	13.46	13.52		Allowable Reference Values:
3	1:07 PM	13.46	13.52		12.5-15 %O2 (50-60% of span)
	Mean (%O2)	13.46	13.52		Cylinder ID: EB0053431
	Difference of means (|R-A|) (%O2)	0.1	*Limit 0.5*	*Passed*	Expiration Date: 6/13/2023
	Linearity Error (%)	0.4	*Limit 5.0*	*Passed*	EPA Vendor ID: G12015
					Cylinder contains: O2,BALN
High Gas					
1	12:42 PM	22.14	22.08		
2	12:57 PM	22.14	22.08		Allowable Reference Values:
3	1:12 PM	22.14	22.09		20-25 %O2 (80-100% of span)
	Mean (%O2)	22.14	22.08		Cylinder ID: ALM064777
	Difference of means (|R-A|) (%O2)	0.1	*Limit 0.5*	*Passed*	Expiration Date: 5/9/2027
	Linearity Error (%)	0.3	*Limit 5.0*	*Passed*	EPA Vendor ID: B72018
					Cylinder contains: CO2,O2,BALN

Linearity Error (LE) Determination

*LE (%) = (|R-A| / R) * 100*

R = Reference gas value

A = Mean of actual CEMS responses

APPENDIX 5

DAHS VERIFICATION DOCUMENTATION

CUSTOM INSTRUMENTATION SERVICES CORPORATION

Data Acquisition and Handling System (DAHS) Verification Documentation

CeDAR and Breez75X ECMPS Reporting Software

Developed by:
Custom Instrumentation Services Corporation

EPA Regulations

- 40CFR75 Acid Rain
- 40CFR97 CSAPR NOx and SO_2

This letter serves as notice that the required 40 CFR 75 DAHS (missing data and formula) verification have been conducted and passed.

The attached formula verification document which includes CeDAR printouts demonstrates that the DAHS accurately calculates regulated parameters using raw data. In addition, verification tests have been conducted and passed for all missing data substitution routines for ECMPS reporting according to all applicable regulations and specifications in 40 CFR 75 Appendix D and Subpart D. The attached checklist, as adapted from Section 15 of the Acid Rain Program Policy Manual (revised) for 40CFR75, provides the regulatory description of the data substitution criteria.
These verification tests were conducted using numerous data sets at varying loads and operating conditions as well as various missing data periods as described in each set of tests. The tests were conducted using data sets with known outcomes and criteria and were verified against those outcomes. All missing data substitution procedures have been verified to be accurate and correct. Detailed data sets and documentation and test documentation are provided below

Walt Bastron
President

SO_2 Missing Data Verification Checklist [1]

Initial SO_2 Data Substitution: 75.31

Description	Regulation
Prior to 720 QA hours, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.31(b)(1)
Prior to 720 QA hours, non-QA data is substituted with the MPC if previous QA data does not exist.	75.31(b)(2)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard SO_2 Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period.	75.33(b)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period.	75.33(b)(2)(ii)(B)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period.	75.33(b)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(b)(4)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous SO_2 Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

1 The SO2 missing data verification mentioned here does not apply to Cricket Valley Energy Center

O_2 Missing Data Verification Checklist

Initial O_2 Data Substitution: 75.31

Description	Regulation
Prior to 720 QA hours, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(b) 75.31(b)(1)
Prior to 720 QA hours, non-QA data is substituted with the MPC if previous QA data does not exist.	75.36(b) 75.31(b)(2)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard O2 Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 10th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 10th percentile of the lookback period.	75.36(d) 75.33(b)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 5th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 5th percentile of the lookback period.	75.36(d) 75.33(b)(2)(ii)(B)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the minimum value in the lookback period.	75.36(d) 75.33(b)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.36(d) 75.33(b)(4)
Substitution routines have a maximum lookback period of 26280 hours.	75.36(d) 75.33(a)

Miscellaneous SO_2 Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.31(c)(1)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range.	75.31(c)(2)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges.	75.31(c)(3)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range.	75.33(c)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range.	75.33(c)(2)(ii)(B)

For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range.	75.33(c)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(c)(4)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used.	75.33(c)(5)
If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous NOx Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

Appendix D Fuel Flow Rate Missing Data Verification Checklist

Single Fuel Hours, Load Based: Appendix D

Description	Regulation
Non-QA data is substituted with the average of the lookback period at the corresponding load range when only the same fuel was combusted.	App. D 2.4.2.2.1
Non-QA data is substituted with the average of the lookback period at the next higher available load range when only the same fuel was combusted if no data in the corresponding load range exists.	App. D 2.4.2.2.1
Non-QA data is substituted with the a maximum potential flow rate if no data in the lookback period at the corresponding or higher load range when only the same fuel was combusted exists.	App. D 2.4.2.2.1
Substitution routines have a maximum lookback period of 26280 hours.	App. D 2.4.3

Co-Fired Fuel Hours, Load Based: Appendix D

Description	Regulation
Non-QA data is substituted with the maximum in the lookback period at the corresponding load range when the same fuel is co-fired with another fuel.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Non-QA data is substituted with the maximum in the lookback period at the next higher available load range when the same fuel is co-fired with another fuel.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Non-QA data is substituted with a maximum potential flow rate if no data in the lookback period at the corresponding or higher load range when the same fuel is co-fired with another fuel exists.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Substitution routines have a maximum lookback period of 26280 hours.	App. D 2.4.3

Note: If Maximum Heat Rate is exceeded, manual adjustment of Fuel Flows is allowed so that reported Heat Rate equals the maximum. (App. D 2.4.2.3.4)

Fuel Specific NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.31(c)(1)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range.	75.31(c)(2)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges.	75.31(c)(3)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Fuel Specific NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(i) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(ii)(A) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(ii)(B) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(i) 75.33(c)(8)(i) 75.33(c)(8)(ii)

For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(ii)(A) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(ii)(B) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(3) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a fuel specific MPC.	75.33(c)(4) 75.33(c)(8)(iii)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(5) 75.33(c)(8)(i) 75.33(c)(8)(ii)
If no data in the corresponding or higher load ranges exists in the lookback period, the fuel specific MPC is used.	75.33(c)(6) 75.33(c)(8)(iii)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a) 75.33(c)(8)

Miscellaneous Fuel Specific NO_X Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

Season Specific NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(1) 75.74(c)(7)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(2) 75.74(c)(7)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges. Historical data is separated into season specific pools.	75.31(c)(3) 75.74(c)(7)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Season Specific NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(i) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(A) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(B) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(2)(i) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(2)(ii)(A) 75.34(a)(2) 75.74(c)(7)

For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(2)(ii)(B) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(3) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with an MPC.	75.33(c)(4) 75.74(c)(7)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used. Historical data is separated into season specific pools.	75.33(c)(5) 75.34(a)(2) 75.74(c)(7)
If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6) 75.34(a)(2) 75.74(c)(7)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a) 75.34(a)(2) 75.74(c)(7)

Miscellaneous Season Specific NO_X Data Substitution

Description	Regulation

	lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.		
	For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90% and less than 95%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 5th percentile of the lookback period.	75.36(d) 75.33(b)(2)(ii)(B)	DS1 6/17/99
	For non-QA data blocks with an availability greater than or equal to 80% and less than 90%, non-QA data is substituted with the minimum value in the lookback period.	75.36(d) 75.33(b)(3)	DS1 6/30/99
	For non-QA data blocks with an availability below 80%, non-QA data is substituted with a MPC.	75.36(d) 75.33(b)(4)	DS1 7/31/99
	Substitution routines have a maximum lookback period of 26280 hours.	75.36(d) 75.33(a)	DS3 3/31/02

Miscellaneous SO2 Data Substitution

P/F	Description	Regulation	Test
	For Non-QA data blocks that cross quarter boundaries, the missing data block ends or starts with the quarter.	Reporting Instructions II(C)(12)	DS3 6/30/03 7/1/03
	For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)	DS3 8/6/03

NOx Missing Data Verification Checklist

Initial NOx Data Substitution: 75.31

P/F	Description	Regulation	Test
	Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.31(c)(1)	DS1 1/1/99
	Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range.	75.31(c)(2)	DS2 4/3/99
	Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges.	75.31(c)(3)	DS1 1/1/99
	Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)	DS3 12/30/01

4 The dates and data sets for in-house testing of formulas, monitor code logic and general software testing is historical, but is consistent with the operations required by the most recent regulatory requirements.

5 The stack SO2 missing data verification mentioned here does not apply to Cricket Valley Energy Center

Standard NOx Data Substitution: 75.33

P/F	Description	Regulation	Test
	For non-QA data blocks less than or equal to 24 hours with an availability of 95% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(1)(i)	DS1 4/20/99
	For non-QA data blocks greater than 24 hours with an availability of 95% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(1)(ii)(A)	DS2 1/3/00
	For non-QA data blocks greater than 24 hours with an availability of 95% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range.	75.33(c)(1)(ii)(B)	DS1 5/31/99
	For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90% and less than 95%, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(2)(i)	DS1 6/16/99
	For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90% and less than 95%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(2)(ii)(A)	DS1 6/17/99
	For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90% and less than 95%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range.	75.33(c)(2)(ii)(B)	DS1 6/17/99
	For non-QA data blocks with an availability greater than or equal to 80% and less than 90%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range.	75.33(c)(3)	DS1 6/21/99
	For non-QA data blocks with an availability below 80%, non-QA data is substituted with a MPC.	75.33(c)(4)	DS1 8/3/99
	If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used.	75.33(c)(5)	DS2 1/3/00
	If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6)	DS2 1/3/00
	Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)	DS3 3/31/02

Appendix D Fuel Flow Rate Missing Data Verification Checklist

Single Fuel Hours, Load Based: Appendix D

P/F	Description	Regulation	Test
	Non-QA data is substituted with the average of the lookback period at the corresponding load range when only the same fuel was combusted.	App. D 2.4.2.2.1	DS1 1/24/99
	Non-QA data is substituted with the average of the lookback period at the next higher available load range when only the same fuel was combusted if no data in the corresponding load range exists.	App. D 2.4.2.2.1	DS2 1/2/00
	Non-QA data is substituted with the a maximum potential flow rate if no data in the lookback period at the corresponding or higher load range when only the same fuel was combusted exists.	App. D 2.4.2.2.1	DS2 1/1/99
	Substitution routines have a maximum lookback period of 26280 hours.	App. D 2.4.3	DS3 6/30/03

Co-Fired Fuel Hours, Load Based: Appendix D

P/F	Description	Regulation	Test
	Non-QA data is substituted with the maximum in the lookback period at the corresponding load range when the same fuel is co-fired with another fuel.	App. D 2.4.2.3.1 App. D 2.4.2.3.3	DS1 1/1/99
	Non-QA data is substituted with the maximum in the lookback period at the next higher available load range when the same fuel is co-fired with another fuel.	App. D 2.4.2.3.1 App. D 2.4.2.3.3	DS2 1/3/00
	Non-QA data is substituted with a maximum potential flow rate if no data in the lookback period at the corresponding or higher load range when the same fuel is co-fired with another fuel exists.	App. D 2.4.2.3.1 App. D 2.4.2.3.3	DS1 1/1/99
	Substitution routines have a maximum lookback period of 26280 hours.	App. D 2.4.3	DS3 6/30/03

Note: If Maximum Heat Rate is exceeded, manual adjustment of Fuel Flows is allowed so that reported Heat Rate equals the maximum. (App. D 2.4.2.3.4)

February 25, 2020

1.0 INTRODUCTION

Air Hygiene International, Inc. (Air Hygiene) has completed the Relative Accuracy Test Audit (RATA) for nitrogen oxides (NOx), carbon monoxide (CO), ammonia (NH_3), and oxygen (O_2) from the exhaust of the General Electric, 7F.05, Unit #U-00002 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. This report details the background, results, process description, and the sampling/analysis methodology of the stack sampling survey conducted on February 25, 2020.

The accumulated data from the RATA provides the figures for evaluating the acceptability of the operation of the on-site continuous emission monitoring system (CEMS) for the monitoring of NOx, CO, NH_3, and O_2 from the General Electric, 7F.05, Unit #U-00002 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York.

1.1 TEST PURPOSE AND OBJECTIVES

The purpose of the test was to perform the initial certification RATA on the CEMS that serves the General Electric, 7F.05, Unit #U-00002 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. Reference method (RM) testing followed the Code of Federal Regulations (CFR), Title 40 (40 CFR), Part 60 (40 CFR 60), Appendix A, Methods 1, 3A, 7E, 10, 19; and 40 CFR 63, Appendix A, Method 320. RM values are compared with the on-site CEMS to document performance as required in the 40 CFR 60, Appendix B, Performance Specifications (PS) and 40 CFR 75 Appendix A and B. All relative accuracies were established on-site and were governed by the following sets of rules:

In accordance with 40 CFR 60, Appendix B, PS 2, Section 13.2, the NOx and NH_3 RATA results are acceptable if the relative accuracy (RA) does not exceed 20.0 percent when average emissions during the test are greater than 50 percent of the emission standard or alternative relative accuracy (ARA) does not exceed 10.0 percent when the average emissions during the test are less than 50 percent of the emission standard. Part 60 further requires that the unit be operating at greater than 50 percent of normal load.

In accordance with 40 CFR 75, Appendix A, Section 3.3.2(a) and (b), the NOx RATA results are acceptable if the relative accuracy (RA) does not exceed 10.0 percent or if during the RATA the average NOx emission rate is less than or equal to 0.200 lb/MMBtu and the average difference between the CEMS and reference method (RM) values does not exceed 0.020 lb/MMBtu. Passing this set of criteria requires the CEMS to be retested after no more than two operating quarters. Alternatively, in accordance with 40 CFR 75, Appendix B, Section 2.3.1.2(a) and (f), and Appendix B, Figure 2, the NOx RATA results are acceptable if the RA does not exceed 7.5 percent or if during the RATA the average NOx emission rate is less than or equal to 0.200 lb/MMBtu and the average difference between the CEMS and RM values does not exceed 0.015 lb/MMBtu. Passing this set of criteria allows the CEMS to be retested after four operating quarters or at least within eight calendar quarters.

In accordance with 40 CFR 60, Appendix B, PS 3, Section 13.2, the O_2 RATA results are acceptable if the relative accuracy (RA) does not exceed 20.0 percent or if the average difference between the CEMS and reference method (RM) values does not exceed plus or minus 1.0 percent of the measured value.

In accordance with 40 CFR 60, Appendix B, PS 4 and 4A, Sections 13.2 of each, the CO relative accuracy (RA) test results are acceptable if the RA does not exceed 10.0 percent, if the average difference between the CEMS and reference method (RM) values plus the 2.5 percent confidence coefficient (2.5%CC) does not exceed 5.0 parts per million (ppm), or if the alternative relative accuracy (ARA) does not exceed 5.0 percent. Part 60 further requires that the unit be operating at greater than 50 percent of normal load.

1.2 SUMMARY OF TEST PROGRAM

The following list details pertinent information related to this specific project:

1.2.1 Participating Organizations
- New York State Department of Environmental Conservation (NYSDEC)
- Cricket Valley Energy Center LLC
- Custom Instrumentation Services Corporation (CiSCO)
- Bechtel
- Air Hygiene

1.2.2 Industry
- Electric Utility / Electric Services

1.2.3 Air Permit and Federal Requirements
- Permit Number: 3-1326-00275/00009
- DEC ID: 3132600275
- 40 CFR 60, Appendix B, Performance Specifications (PS)
- 40 CFR 75, Appendix A and B

1.2.4 Plant Location
- Cricket Valley Energy Center in Dover Plains, New York
  - GPS Coordinates [Latitude 41.67616, Longitude -73.576914]
  - 2241 Route NY 22, Dover Plains, New York 12522
  - Federal Registry System / Facility Registry Service (FRS) No. – 110043333372
  - Source Classification Code (SCC) – 20100209

1.2.5 Equipment Tested
- General Electric, 7F.05, Unit #U-00002
  - NOx Analyzer (TAPI T200M, Serial No. 1013)
  - NH_3 Analyzer (TAPI T200M, Serial No. 1048)
  - CO Analyzer (TAPI T300M, Serial No. 519)
  - O_2 Analyzer (TAPI T803, Serial No. 129)

1.2.6 Emission Points
- Exhaust from the General Electric, 7F.05, Unit #U-00002
- For all gases, one sample point in the exhaust duct from the General Electric, 7F.05, Unit #U-00002, determined after conducting a stratification test

1.2.7 Emission Parameters Measured
- NOx
- CO
- NH_3
- O_2

1.2.8 Date of Emission Test
- February 25, 2020

1.2.9 Federal Certifications

- Stack Testing Accreditation Council AETB Certificate No. 3796.02
- International Standard ISO/IEC 17025:2005 Certificate No. 3796.01

2.0 SUMMARY OF TEST RESULTS

Results from the sampling conducted on Cricket Valley Energy Center LLC's General Electric, 7F.05, Unit #U-00002 located at the Cricket Valley Energy Center on February 25, 2020 are summarized in the following table and relate only to the items tested.

TABLE 2.1
SUMMARY OF GENERAL ELECTRIC, 7F.05, UNIT #U-00002 RATA RESULTS

Pollutant	Units	Criteria			Results	Passed / Test Frequency
		CFR	Specification / Section	Standard		
NOx	ppmvd@15%O_2	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 7.84%	YES / ANNUAL
NOx	lb/hr	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 7.32%	YES / ANNUAL
NOx	lb/MMBtu	Part 75	Appendix A, Section 3.3.2(a),(b) Appendix B, Section 2.3.1.2(a),(f), Figure 2	RA ≤ 10%, or if lb/MMBtu ≤ 0.200, d ≤ ±0.020 lb/MMBtu Annual Incentive RA ≤ 7.5%, or if lb/MMBtu ≤ 0.2, d ≤ ±0.015 lb/MMBtu	RA = 7.88% RM = 0.01 lb/MMBtu d = 0.000 lb/MMBtu BAF=1.000	YES / ANNUAL
O_2	%vd	Part 60	Appendix B, Performance Specification 3, Section 13.2	RA ≤ 20%, or d ≤ ±1.0%	RA = 1.70% d = 0.2 %	YES / ANNUAL
CO	ppmvd@15%O_2	Part 60	Appendix B, Performance Specification 4, 4A, from all Section 13.2	RA ≤ 10%, or d + 2.5% CC ≤ ±5 ppmv, or ARA ≤ 5%	RA = 87.96% |d|+2.5%CC = 0.1 ppm	YES / ANNUAL
CO	lb/hr	Part 60	Appendix B, Performance Specification 4, 4A Section 13.2	RA ≤ 10%, or d + 2.5% CC ≤ ±5 lb/hr, or ARA ≤ 5%	RA = 98.88% |d|+2.5%CC = 0.1 ppm (|d|+2.5%CC = 0.7 lb/hr)	YES / ANNUAL
NH_3	ppmvd@15%O_2	Assumed Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	ARA = 4.38%	YES / ANNUAL
NH_3	lb/hr	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	ARA = 6.50%	YES / ANNUAL
Load	MW	Part 60	Appendix B, Performance Specifications	> 50% max load	354.2	WITHIN TOLERANCE
Load	MW	Part 75	Appendix A and B	normal load range	354.2	WITHIN TOLERANCE

Notes: RA = relative accuracy, ARA = alternative relative accuracy, RM = reference method value, d = difference between RM and CEMS value, CC = confidence coefficient, v = velocity, BAF = bias adjustment factor

The RATA passed for all pollutants (NOx, CO, NH_3, and O_2) in all units (ppm@15%O_2, lb/hr, lb/MMBtu, and %) under all 40 CFR 60 and 40 CFR 75 criteria.

Specifically, NOx in units of ppm@15%O_2 and lb/hr, passed 40 CFR 60 criteria with an RA less than 20 percent. NOx in units of lb/MMBtu passed the 40 CFR 75 alternative annual incentive criteria with an emissions rate of less than 0.200 lb/MMBtu and a difference between the RM and CEMS analyzers of less than 0.015 lb/MMBtu. Also the Bias Adjustment Factor test resulted in an adjustment factor equal to 1.0 (no adjustment required). O_2 in units of % passed the 40 CFR 60 criteria with an RA less than 20 percent. CO in units of ppm@15%O_2 and lb/hr passed the 40 CFR 60 alternative criteria with a concentration difference between the RM and CEMS analyzers plus the confidence coefficient of less than 5 ppm and 5 lb/hr respectively. NH_3 in units of ppm@15%O_2 and lb/hr passed the 40 CFR 60 criteria with an RA less than 20 percent.

Unit load was within the 40 CFR 60 required criteria of greater than 50 percent of the maximum load and also fell within the normal load criteria as defined by the plants Quality Control and Monitoring Plan which defined the upper and lower boundary on the unit and the normal and secondary normal load ranges.

The results of all measured pollutant emissions were below the required limits. All testing was performed without any real or apparent errors. All testing was conducted according to the approved testing protocol.

3.0 SOURCE OPERATION

3.1 PROCESS DESCRIPTION

Cricket Valley Energy Center LLC (CVEC) owns and operates the Cricket Valley Energy Center located at 2241 ST RTE 22 in Dover Plains, New York. Located on the Cricket Valley Energy Center are three General Electric (GE) 7F.05 Combustion Turbine Generators (CTGs), designated as U-00001, U-00002, and U-0003, and each unit is equipped with one heat recovery steam generator (HRSG) with supplemental duct firing. Each unit is rated at 381 megawatts (MW). The nominal MW per unit as per the NYSDEC Permit ID 3-1326-00275/00009 is identified as 333 MW.

A single, dedicated dry extraction based continuous emissions monitoring system (CEMS) is installed on each unit. The CEMS configurations include nitrogen oxide (NOx) analyzers, ammonia (NH_3) analyzers, carbon monoxide (CO) analyzers, diluent gas oxygen (O_2) analyzers, and data acquisition and handling systems (DAHS).

3.2 SAMPLING LOCATION

The CTG stack is vertical, circular, and measures 19 feet (ft) (228 inches) in diameter at the test ports which are approximately 265.8 ft above grade level with an exit elevation of approximately 282.5 ft above grade level. The test ports are located approximately 70.8 ft (850 inches) downstream and approximately 16.7 ft (200.4 inches) upstream from the nearest disturbances. Air Hygiene has field verified the measurable dimensions. Non-field verified dimensions are provided by Cricket Valley Energy Center LLC. All exhaust samples for gaseous emissions were continuously drawn from the exhaust system at the sample ports from a single point determined after conducting a stratification test. During the stratification test three points were traversed from each of the four ports. The probe was allowed to remain at a point for two times the system response time.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

4.1 TEST METHODS

The emission test on the General Electric, 7F.05, Unit #U-00002 at the Cricket Valley Energy Center was performed following United States Environmental Protection Agency (EPA) methods described by the Code of Federal Regulations (CFR). Table 4.1 outlines the specific methods performed on February 25, 2020.

TABLE 4.1
SUMMARY OF SAMPLING METHODS

Pollutant or Parameter	Sampling Method	Analysis Method
Sample Point Location	EPA Method 1	Equal Area Method
Oxygen	EPA Method 3A	Paramagnetic Cell
Nitrogen Oxides	EPA Method 7E	Chemiluminescent Analyzer
Carbon Monoxide	EPA Method 10	Nondispersive Infrared Analyzer
Stack Flow Rate	EPA Method 19	Dry Oxygen F Factor
Ammonia and Moisture	EPA Method 320	Fourier Transform Infrared

4.2 INSTRUMENT CONFIGURATION AND OPERATIONS FOR GAS ANALYSIS

The sampling and analysis procedures used during these tests conform with the methods outlined in the Code of Federal Regulations (CFR), Title 40, Part 60, Appendix A, Methods 1, 3A, 7E, 10, 19; and 40 CFR 63, Appendix A, Method 320.

Figure 4.1 depicts the sample system used for the real-time gas analyzer tests. The gas sample was continuously pulled through the probe and transported, via heat-traced Teflon® tubing, to a heated head pump and into the FTIR then to a stainless steel minimum-contact condenser designed to dry the sample. Transportation of the sample, through Teflon® tubing, continued into the sample manifold within the mobile laboratory / portable analyzer via a stainless steel/Teflon® diaphragm pump. From the manifold, the sample was partitioned to the real-time analyzers through rotameters that controlled the flow rate of the sample.

Figure 4.1 shows that the sample system was also equipped with a separate path through which a calibration gas could be delivered to the probe and back through the entire sampling system. This allowed for convenient performance of system bias checks as required by the testing methods.

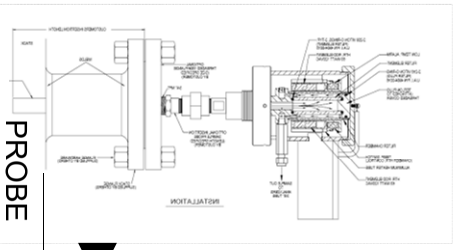
All instruments were housed in a climate controlled, trailer-mounted mobile laboratory. Gaseous calibration standards were provided in aluminum cylinders with the concentrations certified by the vendor. EPA Protocol No. 1 was used to determine the cylinder concentrations where applicable (i.e. NOx calibration gases).

Table 4.2 provides a description of the analyzers used for the instrument portion of the tests. All data from the continuous monitoring instruments were recorded on a Logic Beach Portable Data Logging System which retrieves calibrated electronic data from each instrument every one second and reports an average of the collected data every 30 seconds. For target compounds measured with the Fourier transform infrared (FTIR) spectrometer, interferograms consisting of 28 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations. Spectral data was analyzed by the MKS MG2000 software.

Eleven test runs of approximately 21 minutes each were conducted on the General Electric, 7F.05, Unit #U-00002 for NOx, CO, NH_3, and O_2.

The stack gas analysis for O_2 concentrations was performed in accordance with procedures set forth in EPA Method 3A. The O_2 analyzer uses a paramagnetic cell detector.

EPA Method 7E was used to determine concentrations of NOx. A chemiluminescent analyzer was used to determine the nitrogen oxides concentration in the gas stream. A NO_2 in nitrogen certified gas cylinder was used to verify at least a 90 percent NO_2 conversion on the day of the test.



CO emission concentrations were quantified in accordance with procedures set forth in EPA Method 10. A continuous nondispersive infrared (NDIR) analyzer was used for this purpose.

An MKS Instruments - MultiGas™ Fourier Transform Infrared (FTIR) spectrometer, or equivalent, was used for NH_3 and H_2O analysis per EPA Method 320. The FTIR spectrometer spectral resolution was 0.5 cm^{-1}. The system employed a silicon carbide infrared source at 1200ºC, a helium neon reference laser, beam splitters, potassium bromide (KBr) cell window, front-surface optical transfer mirrors, and multi-pass absorption cells. MCT detectors were used and cooled with liquid nitrogen in order to maintain a constant temperature of 77 Kelvin. The approximately 5.11-meter multi-pass path cells incorporated aspheric, aberration-correcting mirrors to increase the optical throughput and the detection sensitivity. Transducers and thermocouples were connected directly to the insulated sample cells that provide the pressure and temperatures of the sample streams. During testing, the temperature of the absorption cells was set at 191ºC. Elevated temperature prevented gas condensation within the cell and minimized compound adhesion to the cell walls and mirrors. The volume of the absorption cell was 0.5 liters, so at a sample gas flow rate of 4.0 liters per minute, the sample gas in the cell is refreshed approximately four times each minute. Interferograms consisting of 28 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations.

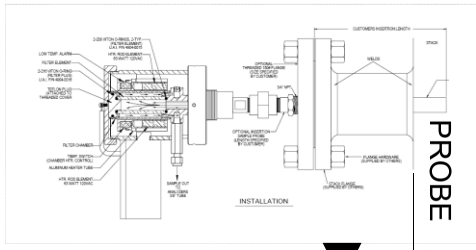


TABLE 4.2
ANALYTICAL INSTRUMENTATION

Parameter	Manufacturer and Model	Range	Sensitivity	Detection Principle
NOx	THERMO 42 series	User may select up to 5,000 ppm	0.1 ppm	Thermal reduction of NO_2 to NO. Chemiluminescence of reaction of NO with O_3. Detection by PMT. Inherently linear for listed ranges.
CO	THERMO 48 series	User may select up to 10,000 ppm	0.1 ppm	Infrared absorption, gas filter correlation detector, microprocessor based linearization.
NH_3 and H_2O	MKS 2030	User may select from multiple ranges	0.1 ppm	Fourier Transform Infrared – FTIR
O_2	SERVOMEX 1440	0-25%	0.1%	Paramagnetic cell, inherently linear.

Part 60, Appendix B, Performance Specification 3,
13.2 CEMS Relative Accuracy Performance Specification. The RA of the CEMS must be no greater than 20 percent of the mean value of the reference method (RM) data. The results are also acceptable if the absolute value of the difference between the mean RM value and the mean CEMS value is less than or equal to 1.0 percent O2 (or CO2).

Part 60, Appendix B, Performance Specification 4,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS having span values of 1,000 ppmv CO.
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA or 5 percent when the applicable emission standard (permit limit) is used to calculate RA.

Part 60, Appendix B, Performance Specification 4A,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS that comply with low emission standards (less than 200 ppmv).
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA, 5 percent when the applicable emission standard (permit limit) is used to calculate RA, or within 5 ppmv when the RA is calculated as the absolute average difference between the RM and CEMS plus the 2.5 percent confidence coefficient.

Part 75, Appendix A,
3.3.2 Relative Accuracy for NOX-Diluent Continuous Emission Monitoring Systems
(a) The relative accuracy for NOX-diluent continuous emission monitoring systems shall not exceed 10.0 percent.
(b) For affected units where the average of the reference method measurements of NOX emission rate (this means lb/MMBtu) during the relative accuracy test audit is less than or equal to 0.200 lb/mmBtu, the difference between the mean value of the continuous emission monitoring system measurements and the reference method mean value shall not exceed ±0.020 lb/mmBtu, wherever the relative accuracy specification of 10.0 percent is not achieved.

7.6.5 Bias Adjustment
(b) For single-load RATAs of SO2 pollutant concentration monitors, NOX concentration monitoring systems, and NOX-diluent monitoring systems and for the single-load flow RATAs required or allowed under section 6.5.2 of this appendix and sections 2.3.1.3(b) and 2.3.1.3(c) of Appendix B to this part, the appropriate BAF is determined directly from the RATA results at normal load, using Equation A-12. Notwithstanding, when a NOX concentration CEMS or an SO2 CEMS or a NOX-diluent CEMS installed on a low-emitting affected unit (i.e., average SO2 or NOX concentration during the RATA &IE; 250 ppm or average NOX emission rate &IE; 0.200 lb/mmBtu) meets the normal 10.0 percent relative accuracy specification (as calculated using Equation A-10) or the alternate relative accuracy specification in section 3.3 of this appendix for low-emitters, but fails the bias test, the BAF may either be determined using Equation A-12, or a default BAF of 1.111 may be used.

Part 75, Appendix B,
2.3.1.2 Reduced RATA Frequencies. Relative accuracy test audits of primary and redundant backup SO2 pollutant concentration monitors, CO2 pollutant concentration monitors (including O2 monitors used to determine CO2 emissions), CO2 or O2 diluent monitors used to determine heat input, moisture monitoring systems, NOX concentration monitoring systems, flow monitors, NOX-diluent monitoring systems or SO2-diluent monitoring systems may be performed annually (i.e., once every four successive QA operating quarters, rather than once every two successive QA operating quarters) if any of the following conditions are met for the specific monitoring system involved:
(a) The relative accuracy during the audit of an SO2 or CO2 pollutant concentration monitor (including an O2 pollutant monitor used to measure CO2 using the procedures in appendix F to this part), or of a CO2 or O2 diluent monitor used to determine heat input, or of a NOX concentration monitoring system, or of a NOX-diluent monitoring system, or of an SO2-diluent continuous emissions monitoring system is ≤ 7.5 percent;

(f) For units with low NOX emission rates (average NOX emission rate measured by the reference method during the RATA ≤ 0.200 lb/mmBtu), when a NOX-diluent continuous emission monitoring system fails to achieve a relative accuracy ≤ 7.5 percent, but the monitoring system mean value from the RATA, calculated using Equation A-7 in appendix A to this part, is within ± 0.015 lb/mmBtu of the reference method mean value;

Figure 2 to Appendix B of Part 75_Relative Accuracy Test Frequency Incentive System.

RATA	Semiannual(percent)(1)	Annual(1)
SO2 or NOX(3)	7.5% < RA ≤ 10.0% or ± 15.0 ppm(2)	RA ≤ 7.5% or ± 12.0 ppm(2)
SO2-diluent	7.5% < RA ≤ 10.0% or ± 0.030 lb/mmBtu(2)	RA ≤ 7.5% or ± 0.025 lb/mmBtu(2)
NOX-diluent	7.5% < RA ≤ 10.0% or ± 0.020 lb/mmBtu(2)	RA ≤ 7.5% or ± 0.015 lb/mmBtu(2)
Flow	7.5% < RA ≤ 10.0% or ± 2.0 fps(2)	RA ≤ 7.5% or ± 1.5 fps
CO2 or O2	7.5% < RA ≤ 10.0% or ± 1.0% CO2/O2(2)	RA ≤ 7.5% or ± 0.7% CO2/O2(2)
Moisture	7.5% < RA ≤ 10.0% or ± 1.5% H2O(2)	RA ≤ 7.5% or ± 1.0% H2O(2)

(1) The deadline for the next RATA is the end of the second (if semiannual) or fourth (if annual) successive QA operating quarter following the quarter in which the CEMS was last tested. Exclude calendar quarters with fewer than 168 unit operating hours (or, for common stacks and bypass stacks, exclude quarters with fewer than 168 stack operating hours) in determining the RATA deadline. For SO2 monitors, QA operating quarters in which only very low sulfur fuel as defined in § 72.2, is combusted may also be excluded. However, the exclusion of calendar quarters is limited as follows: the deadline for the next RATA shall be no more than 8 calendar quarters after the quarter in which a RATA was last performed.
(2) The difference between monitor and reference method mean values applies to moisture monitors, CO2, and O2 monitors, low emitters, or low flow, only.
(3) A NOX concentration monitoring system used to determine NOX mass emissions under § 75.71.

Calculations, Formulas, and Constants

The following information supports the spreadsheets for this testing project.

Given Data:

Ideal Gas Conversion Factor = 385.23 SCF/lb-mol at 68 deg F & 14.696 psia

Fuel Heating Value is based upon Air Hygiene's fuel gas calculation sheet. All calculations are based upon a correction to 68 deg F & 14.696 psia

High Heating Values (HHV) are used for the Fuel Heating Value, F-Factor, and Fuel Flow Data per EPA requirements.

ASTM D 3588

Molecular Weight of NOx (lb/lb-mole) =	46.01
Molecular Weight of CO (lb/lb-mole) =	28.00
Molecular Weight of SO_2 (lb/lb-mole) =	64.00
Molecular Weight of THC (propane) (lb/lb-mole) =	44.00
Molecular Weight of VOC (methane) (lb/lb-mole) =	16.00
Molecular Weight of NH_3 (lb/lb-mole) =	17.03
Molecular Weight of HCHO (lb/lb-mole) =	30.03
Molecular Weight of CO_2 (lb/lb-mole) =	44.01

40CFR60, App. A., RM 19, Table 19-1

Conversion Constant for NOx =	0.0000001194351
Conversion Constant for CO =	0.0000000726839
Conversion Constant for SO_2 =	0.0000001661345
Conversion Constant for THC =	0.0000001142175
Conversion Constant for VOC (methane) =	0.0000000415336
Conversion Constant for NH_3 =	0.0000000442074
Conversion Constant for HCHO =	0.0000000779534
Conversion Constant for CO_2 =	0.0000001142434

NOTE: units are lb/ppm*ft^3

Formulas:

1. Corrected Raw Average (C_{Gas}), 40CFR60, App. A, RM 7E, Eq. 7E-5 (08/15/06)

$$C_{Gas} = (C_{Avg} - C_O) \times \left(\frac{C_{MA}}{C_M - C_O} \right)$$

2. Correction to % O_2, 40CFR60, App. A, RM 20, Eq. 20-5 (11/26/02)

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}} \right)$$

3. Correction to % O_2 and ISO Conditions

$$C_{ISO} = C_{Adj} \times \sqrt{\frac{P_r}{P_o}} \times e^{(19 \times (H_O - 0.00633))} \times \left(\frac{288}{T_a} \right)^{1.53}$$

4. Method 19 stack exhaust flow (scfh) [ref. EPA EMC FAQ Method 19]

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000} \right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}} \right)$$

5. Emission Rate in lb/hr

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

6. Emission Rate in tons per year

$$E_{ton/yr} = \frac{E_{lb/hr} \times hr_{year}}{2000}$$

7. Emission Concentration in lb/MMBtu (O_2 based)

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$

8. Emission Concentration in g/hp*hr

$$E_{g/hp \cdot hr} = \frac{E_{lb/hr} \times 453.6}{mw \times 1341.022} or \frac{E_{lb/hr} \times 453.6}{hp}$$

RATA SHEET CALCULATIONS

d = Reference Method Data - CEMS Data

S_d = Standard Deviation

CC = Confident Coefficient

n = number of runs

$t_{0.025}$ = 2.5 percent confidence coefficient T-values

RA = relative accuracy

ARA = alternative relative accuracy

BAF = Bias adjustment factor

n	t	n	t	n	t
2	12.706	7	2.447	12	2.201
3	4.303	8	2.365	13	2.179
4	3.182	9	2.306	14	2.160
5	2.776	10	2.262	15	2.145
6	2.571	11	2.228	16	2.131

1. Difference

$$d = \sum_{i=1}^{n} d_i$$

2. Standard Deviation

$$S_d = \sqrt{\frac{\sum_{i=1}^{n} d_i^2 - \left[\frac{\left(\sum_{i=1}^{n} d_i \right)^2}{n} \right]}{n-1}}$$

3. Confident Coefficient

$$CC = t_{0.025} \times \frac{S_d}{\sqrt{n}}$$

4. Relative Accuracy

$$RA = \frac{|d_{AVG}| + |CC|}{RM_{AVG}} \times 100$$

5. Alternative Relative Accuracy

$$ARA = \frac{|d_{AVG}| + |CC|}{AS} \times 100$$

5. Bias Adjustment Factor

$$BAF = 1 + \left(\frac{|d_{AVG}|}{CEM_{AVG}} \right)$$

RM 7E, (08-15-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

ACE = Analyzer calibration error, percent of calibration span.
B_{WS} = Moisture content of sample gas as measured by Method 4 or other approved method, percent/100.
C_{Avg} = Average unadjusted gas concentration indicated by data recorder for the test run.
C_D = Pollutant concentration adjusted to dry conditions.
C_{Dir} = Measured concentration of a calibration gas (low, mid, or high) when introduced in direct calibration mode.
C_{Gas} = Average effluent gas concentration adjusted for bias.
C_M = Average of initial and final system calibration bias (or 2-point system calibration error) check responses for the upscale calibration gas.
C_{MA} = Actual concentration of the upscale calibration gas, ppmv.
C_O = Average of the initial and final system calibration bias (or 2-point system calibration error) check responses from the low-level (or zero) calibration gas.
C_S = Measured concentration of a calibration gas (low, mid, or high) when introduced in system calibration mode.
C_{SS} = Concentration of NOx measured in the spiked sample.
C_{Spike} = Concentration of NOx in the undiluted spike gas.
C_{Calc} = Calculated concentration of NOx in the spike gas diluted in the sample.
C_V = Manufacturer certified concentration of a calibration gas (low, mid, or high).
C_W = Pollutant concentration measured under moist sample conditions, wet basis.
CS = Calibration span.
D = Drift assessment, percent of calibration span.
E_p = The predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response.
Eff_{NO2} = NO_2 to NO converter efficiency, percent.
H = High calibration gas, designator.
L = Low calibration gas, designator.
M = Mid calibration gas, designator.
NOFinal = The average NO concentration observed with the analyzer in the NO mode during the converter efficiency test in Section 16.2.2.
NOxCorr = The NOx concentration corrected for the converter efficiency.
NOxFinal = The final NOx concentration observed during the converter efficiency test in Section 16.2.2.
NOxPeak = The highest NOx concentration observed during the converter efficiency test in Section 16.2.2.
Q_{Spike} = Flow rate of spike gas introduced in system calibration mode, L/min.
Q_{Total} = Total sample flow rate during the spike test, L/min.
R = Spike recovery, percent.
SB = System bias, percent of calibration span.
SB_i = Pre-run system bias, percent of calibration span.
SB_f = Post-run system bias, percent of calibration span.
SB / D_{Alt} = Alternative absolute difference criteria to pass bias and/or drift checks.
SCE = System calibration error, percent of calibration span.
SCE_i = Pre-run system calibration error, percent of calibration span.
SCE_{final} = Post-run system calibration error, percent of calibration span.
Z = Zero calibration gas, designator.

40CFR60.355(b)(1), (09-20-06), Nomenclature. The terms used in the equations are defined as follows:

P_r = reference combustor inlet absolute pressure at 101.3 kilopascals ambient pressure, mm Hg
P_o = observed combustor inlet absolute pressure at test, mm Hg
H_o = observed humidity of ambient air, g H_2O/g air
e = transcendental constant, 2.718
T_a = ambient temperature, K

Small Engine and FTIR Nomenclature. The terms used in the equations are defined as follows:

bhp = brake horsepower
hp = horsepower
Q_{sys} = system flow (lpm)
Q_m = matrix spike flow (lpm)

RM 19, (07-29-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

AdjFactor = Percent oxygen or carbon dioxide adjustment applied to a target pollutant
B_{wa} = Moisture fraction of ambient air, percent.
Btu = British thermal unit
$\%_C$ = Concentration of carbon from an ultimate analysis of fuel, weight percent.
$\%_{CO2d}$,$\%_{CO2w}$ = Concentration of carbon dioxide on a dry and wet basis, respectively, percent.
CIP / CDP = Combustor inlet pressure / compressor discharge pressure (mm Hg); note, some manufactures reference as PCD.
E = Pollutant emission rate, ng/J (lb/million Btu).
E_a = Average pollutant rate for the specified performance test period, ng/J (lb/million Btu).
E_{ao}, E_{ai} = Average pollutant rate of the control device, outlet and inlet, respectively, for the performance test period, ng/J (lb/million Btu).
E_{bi} = Pollutant rate from the steam generating unit, ng/J (lb/million Btu).
E_{bo} = Pollutant emission rate from the steam generating unit, ng/J (lb/million Btu).
E_{ci} = Pollutant rate in combined effluent, ng/J (lb/million Btu).
E_{co} = Pollutant emission rate in combined effluent, ng/J (lb/million Btu).
E_d = Average pollutant rate for each sampling period (e.g.,24-hr Method 6B sample or 24-hr fuel sample) or for each fuel lot (e.g., amount of fuel bunkered), ng/J (lb/million Btu).
E_{di} = Average inlet SO_2 rate for each sampling period d, ng/J (lb/million Btu).
E_g = Pollutant rate from gas turbine, ng/J (lb/million Btu).
E_{ga} = Daily geometric average pollutant rate, ng/J (lbs/million Btu) or ppm corrected to 7 percent O_2.
E_{jo},E_{ji} = Matched pair hourly arithmetic average pollutant rate, outlet and inlet, respectively, ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
E_h = Hourly average pollutant, ng/J (lb/million Btu).
E_{hj} = Hourly arithmetic average pollutant rate for hour "j," ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
EXP = Natural logarithmic base (2.718) raised to the value enclosed by brackets.
Fc = Ratio of the volume of carbon dioxide produced to the gross calorific value of the fuel from Method 19
F_d, F_w, F_c = Volumes of combustion components per unit of heat content, scm/J (scf/million Btu).
ft^3 = cubic feet
G = ideal gas conversion factor
(385.23 SCF/lb-mol at 68 deg F & 14.696 psia)
GCM = gross Btu per SCF (constant, compound based)
GCV = Gross calorific value of the fuel consistent with the ultimate analysis, kJ/kg (Btu/lb).
GCV_p, GCV_r = Gross calorific value for the product and raw fuel lots, respectively, dry basis, kJ/kg (Btu/lb).
$\%_H$ = Concentration of hydrogen from an ultimate analysis of fuel, weight percent.
H_b = Heat input rate to the steam generating unit from fuels fired in the steam generating unit, J/hr (million Btu/hr).
H_g = Heat input rate to gas turbine from all fuels fired in the gas turbine, J/hr (million Btu/hr).
$\%_{H2O}$ = Concentration of water from an ultimate analysis of fuel, weight percent.
H_r = Total numbers of hours in the performance test period (e.g., 720 hours for 30-day performance test period).
K = volume of combustion component per pound of component (constant)
K = Conversion factor, 10^{-5} (kJ/J)/(%) [10^6 Btu/million Btu].
K_c = (9.57 scm/kg)/% [(1.53 scf/lb)/%].
K_{cc} = (2.0 scm/kg)/% [(0.321 scf/lb)/%].
K_{hd} = (22.7 scm/kg)/% [(3.64 scf/lb)/%].
K_{hw} = (34.74 scm/kg)/% [(5.57 scf/lb)/%].
K_n = (0.86 scm/kg)/% [(0.14 scf/lb)/%].
K_o = (2.85 scm/kg)/% [(0.46 scf/lb)/%].
K_s = (3.54 scm/kg)/% [(0.57 scf/lb)/%].
K_{sulfur} = $2x10^4$ Btu/wt%-MMBtu
K_w = (1.30 scm/kg)/% [(0.21 scf/lb)/%].
lb = pound
ln = Natural log of indicated value.
L_p,L_r = Weight of the product and raw fuel lots, respectively, metric ton (ton).
$\%_N$ = Concentration of nitrogen from an ultimate analysis of fuel, weight percent.
$M_{\%}$ = mole percent
mol = mole
MW = molecular weight (lb/lb-mol)
MW_{AIR} = molecular weight of air (28.9625 lb/lb-mole)[1]
NCM = net Btu per SCF (constant based on compound)
$\%_O$ = Concentration of oxygen from an ultimate analysis of fuel, weight percent.
$\%_{O2d}$, $\%_{O2w}$ = Concentration of oxygen on a dry and wet basis, respectively, percent.
P_B = barometric pressure, in Hg
P_s = Potential SO2 emissions, percent.
$\%_S$ = Sulfur content of as-fired fuel lot, dry basis, weight percent.
S_e = Standard deviation of the hourly average pollutant rates for each performance test period, ng/J (lb/million Btu).
$\%_{Sf}$ = Concentration of sulfur from an ultimate analysis of fuel, weight percent.
S(wt%) = weight percent of sulfur, per lab analysis by appropriate ASTM standard
S_i = Standard deviation of the hourly average inlet pollutant rates for each performance test period, ng/J (lb/million Btu).
S_o = Standard deviation of the hourly average emission rates for each performance test period, ng/J (lb/million Btu).
$\%S_p$, $\%S_r$ = Sulfur content of the product and raw fuel lots respectively, dry basis, weight percent.
SCF = standard cubic feet
SH = specific humidity, pounds of water per pound of air
$t_{0.95}$ = Values shown in Table 19-3 for the indicated number of data points n.
T_{amb} = ambient temperature, °F
W/D Factor = 1.0236 = conv. at 14.696 psia and
68 deg F (ref. Civil Eng. Ref. Manual, 7th Ed.)
X_{CO2}=CO_2 Correction factor, percent.
X_k = Fraction of total heat input from each type of fuel k.

EXAMPLE CALCULATIONS (INFORMATION)

Specific Humidity (RH_{sp})

Note: RHsp (gr/lb) calculated using temperature, relative humidity, and barometric pressure with psychrometric chart, psychrometric calculator, or built in psychrometric algorithm.

$$RH_{sp}(lb/lb) = \left[\left(\frac{gr}{lb}\right) \times \frac{lb}{7000\ gr}\right]$$

RH_{sp}= 32.23 gr / lb x 1 lb / 7000 gr = 0.004604 lb H_2O / lb Air

EXAMPLE CALCULATIONS (CALIBRATION)

Analyzer Calibration Error

RM 7E, (02-27-14), 12.2 Analyzer Calibration Error. For non-dilution systems, use Equation 7E-1 to calculate the analyzer calibration error for the low-, mid-, and high-level calibration gases. (calc for NOx analyzer mid gas, if applicable)

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100$$ Eq. 7E-1

ACE = (5.09 ppm - 4.91 ppm) / 9.20 ppm x 100 = 1.96 %

EXAMPLE CALCULATIONS (BIAS, DRIFT, AND CORRECTED RAW AVERAGE)

System Bias

RM 7E, (02-27-14), 12.3 System Bias. For non-dilution systems, use Equation 7E-2 to calculate the system bias separately for the low-level and upscale calibration gases. (calc for NOx analyzer upscale gas, Run 1 initial bias, if applicable)

$$SB = \left(\frac{C_S - C_{Dir}}{CS}\right) \times 100$$ Eq. 7E-2

SB = (4.93 ppm - 5.09 ppm) / 9.20 ppm x 100 = -1.74 %

Drift Assessment

RM 7E, (02-27-14), 12.5 Drift Assessment. Use Equation 7E-4 to separately calculate the low-level and upscale drift over each test run. (calc for NOx analyzer upscale drift, Run 1, if applicable)

$$D = \left|SB_{final} - SB_t\right|$$ Eq. 7E-4

D = | -2.83 % - -1.74 % | = 1.09 %

Alternative Drift and Bias

RM 7E, (02-27-14), 13.2 / 13.3 System Bias and Drift. Alternatively, the results are acceptable if |Cs – Cdir| is ≤ 0.5 ppmv or if |Cs – Cv| is ≤ 0.5 ppmv (as applicable). (calc for NOx analyzer initial upscale, Run 1, if applicable)

$$SB / D_{Alt} = \left|C_S - C_{Dir}\right|$$ Eq. Section 13.2 and 13.3

SB / D_{Alt} = | 4.93 ppm - 5.09 ppm | = 0.16 ppm

Bias Adjusted Average

RM 7E, (02-27-14), 12.6 Effluent Gas Concentration. For each test run, calculate Cavg, the arithmetic average of all valid NOx concentration values (e.g., 1-minute averages). Then adjust the value of Cavg for bias, using Equation 7E-5b. (calc for NOx analyzer, Run 1, if applicable)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$ Eq. 7E-5b

C_{Gas} = (1.85 ppm - -0.26 ppm) (4.91 ppm / 4.88 ppm - -0.26 ppm) = 2.02 ppm

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RUNS)

Stack Exhaust Flow (Q_S) - RM19

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000}\right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}}\right)$$

Note: Equation presented in EPA Emission Measurement Center (EMC), Frequently Asked Questions (FAQ) for Method 19

Q_S = 8,710.00 SCF/MMBtu x 2,317,550.00 SCF/hr x 1,050.00 Btu/SCF x MMBtu/10^6 Btu x [20.90% / (20.9% - 13.4 %)] = 58,713,359.00 SCFH

Moisture Correction

RM 7E, (02-27-14), 12.10 Moisture Correction. Use Equation 7E-10 if your measurements need to be corrected to a dry basis. (calc for NOx analyzer, Run 1, if applicable) Note: Calculations may not match as Run 1 results are typically also bias adjusted

$$C_W = C_D \times (1 - B_{WS})$$

$$C_D = \frac{C_W}{1 - B_{WS}}$$ Eq. 7E-10

C_D = 1.85 ppmvw / (1 - 0.08) = 2.02 ppmvd or inversely, C_W = 2.02 ppmvd x (1 - 0.08) = 1.85 ppmvw

Diluent-Corrected Pollutant Concentration, O_2 Based

RM 20, (11-26-02), 7.3.1 Correction of Pollutant Concentration Using O_2 Concentration. Calculate the O_2 corrected pollutant concentration, as follows: (calc for NOx gas, Run 1, if applicable) [now contained in applicable Subpart]

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$ Eq. 20-4

C_{adj} = 2.02 ppm x [(20.9% - 15.00 %) / (20.9% - 13.36 %)] = 1.58 ppm@15%O_2

Emissions Rate (lb/hr)

Calculation for pound per hour emission rate. Calculate, as follows: (calc for NOx gas Run 1, if applicable)

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

$E_{lb/hr}$ = 2.02 ppmvd / 10^6 ppm/part x 58,713,359 DSCFH x 46.01 lb/lb-mol / 385.23 SCF/lb-mol = 14.14 lb/hr

Emissions Rate (lb/MMBtu)

RM 19, (02-27-14), 12.2 Emission Rates of PM, SO_2, and NOx. Select from the following sections the applicable procedure to compute the PM, SO_2, or NOx emission rate (E) in ng/J (lb/million Btu). (calc for NOx gas Run 1, if applicable)

Oxygen Based

12.2.1 Oxygen-Based F Factor, Dry Basis. When measurements are on a dry basis for both O_2 ($\%O_2$d) and pollutant (Cd) concentrations, use the following equation:

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$ Eq. 19-1

$E_{lb/MMBtu}$ = 2.02 ppm x 8,710.00 SCF/MMBtu x 0.0000001194 lb/ppm*ft^3 x 20.9% / (20.9% - 13.36 %) = 0.006 lb/MMBtu

Conversion Constant

Convc for NOx

$$Conv_c(lb/ppm \cdot ft^3) = \frac{\frac{MW}{G}}{10^6}$$

$Conv_c$ = (46.01 lb/lb•mole x lb•mole/385.23 SCF) / 10^6 = 0.0000001194 lb/ppm-ft^3

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RATA RESULTS)

Difference (d)

40 CFR 75, App A, (12-17-09), 7.3.1 Arithmetic Mean. Calculate the arithmetic mean of the differences, d , of a data set as follows. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$d = \sum_{i=1}^{n} d_i$$ Eq. A-7

d = 0.006 lb/MMBtu - 0.006 lb/MMBtu = 0.000 lb/MMBtu

Standard Deviation

40 CFR 75, App A, (12-17-09), 7.3.2 Standard Deviation. Calculate the standard deviation, Sd, of a data set as follows:
(calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$S_d = \sqrt{\frac{\sum_{i=1}^{n} d_i^2 - \frac{\left[\left(\sum_{i=1}^{n} d_i\right)^2\right]}{n}}{n-1}}$$ Eq. A-8

$$S_d = \sqrt{\frac{0.000 \text{ lb/MMBtu}^2 - \frac{(-0.004 \text{ lb/MMBtu})^2}{9}}{9 - 1}} = 0.000 \text{ lb/MMBtu}$$

Confidence Coefficient

40 CFR 75, App A, (12-17-09), 7.3.3 Confidence Coefficient. Calculate the confidence coefficient (one-tailed), cc, of a data set as follows. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$CC = t_{0.025} \times \frac{S_d}{\sqrt{n}}$$ Eq. A-9

CC = 2.306 x $\frac{0.000 \text{ lb/MMBtu}}{\sqrt{9}}$ = 0.000 lb/MMBtu

T-Values	n	2	3	4	5	6	7	8	9
	$t_{0.025}$	12.706	4.303	3.182	2.776	2.571	2.447	2.365	2.306

2.5 percent confidence coefficients

Relative Accuracy

40 CFR 75, App A, (12-17-09), 7.3.4 Relative Accuracy. Calculate the relative accuracy of a data set using the following equation. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$RA = \frac{|d_{AVG}| + |CC|}{RM_{AVG}} \times 100$$ Eq. A-10

RA = $\frac{|0.000 \text{ lb/MMBtu}| + |0.000 \text{ lb/MMBtu}|}{0.006 \text{ lb/MMBtu}}$ x 100 = 7.88 %

Bias Adjustment Factor (BAF)

40 CFR 75, App A, (12-17-09), 7.6.5 Bias Adjustment. (a) If the monitor or monitoring system fails to meet the bias test requirement, adjust the value obtained from the monitor using the following equation: (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$BAF = 1 + \left(\frac{|d_{AVG}|}{CEM_{AVG}}\right)$$ Eq. A-12

d_{AVG}= 0.000 < |CC| = 0.000 ⇨ BAF = 1 + $\frac{|\quad| \text{ lb/MMBtu}}{\text{lb/MMBtu}}$ = 1.000 lb/MMBtu

Note: BAF only applies if the mean difference (d) is greater than the absolute value of the confidence coefficient.

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

APPENDIX B

CEMS AND REFERENCE METHOD DATA

Cricket Valley Energy Center LLC

Air Permit Number:	3-1326-00275/00009
Plant Name or Location:	Cricket Valley Energy Center
Date:	February 25, 2020
Project Number:	cis-19-cricketvalley.ny-start#1
Manufacturer & Equipment:	General Electric
Model:	7F.05
Unit Number:	U-00002
Test Load:	Base Load
Tester(s) / Test Unit(s):	MM/215

CERTIFICATE OF ANALYSIS
(Zero Ambient Nitrogen)

Cylinder Number:	EB0072934	**Certification Date:**	05/21/2019
Product ID Number:	121026	**Expiration Date:**	05/19/2027
Cylinder Pressure:	1900 PSIG	**MFG Facility:**	RBTGS-Shreveport-LA
COA #	EB0072934.20190521-0	**Lot Number:**	EB0072934.20190521
Customer PO. NO.:		**Tracking Number:**	084249399
Customer:		**Previous Certification Dates:**	

This mixture is for laboratory use only, not for drug, household or other use.
This mixture is certified in Mole % to be within ±2% of the actual number reported with a confidence of 95%.
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

Composing Material: Zero Ambient Nitrogen, Cert., Sz152

Component	Specification	Concentration
Nitrogen	Balance	Balance
Oxygen as Impurity	<1.0 PPM	<1.0 PPM
Carbon Dioxide as Impurity	<0.5 PPM	<0.5 PPM
Carbon Monoxide as Impurity	<0.5 PPM	<0.5 PPM
Total Oxides of Nitrogen as Impurity	<0.1 PPM	<0.1 PPM
Sulfur Dioxide as Impurity	<0.1 PPM	<0.1 PPM
Total Hydrocarbons as Impurity	<0.1 PPM	<0.1 PPM

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

APPENDIX D

QUALITY ASSURANCE AND QUALITY CONTROL DATA

QA/QC PROGRAM

AIR HYGIENE ensures the quality and validity of its emission measurement and reporting procedures through a rigorous quality assurance (QA) program. The program is developed and administered by an internal QA team and encompasses six major areas:

1. Field Qualifications
2. QA reviews of reports, laboratory work, and field testing;
3. Equipment calibration and maintenance;
4. Chain-of-custody;
5. Training; and
6. Knowledge of current test methods

Field Qualifications

Air Hygiene personnel are required to gain and maintain competence with testing methods and techniques according to their job titles and the roles they play during field testing events. Qualifications for each job description include:

Staff Technician - An entry level position with responsibility to test on the stack by performing duties that include: keep trucks and trailers stocked and clean, travel to and from job site, be the "hands of the test" on the stack; stay on a stack during the sample test, set up and tear down equipment on-site, perform maintenance on equipment in the shop and on-site.

Test Technician or Specialist - Acts as the "hands of the test" on the stack by performing duties that include: stay on a stack during the sample test, migrate to the testing trailer and learn the different analyzers and testing methods used on site, set up and tear down testing equipment on site, learn the system for testing from Testing Managers and Project Managers, travel to and from job site; including driving responsibilities under DOT requirements, follow directions of Testing Managers and Project Managers, learn the proper way to conduct on-site test of stationary stacks

Test Manager or Engineer - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Test Managers must hold at least one QSTI certificate.

Project Manager - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Project Managers typically hold QSTI certificates in Groups 1 through 4.

QA Reviews

Air Hygiene's review procedure includes review of each source test report, along with laboratory and fieldwork, by the QA Team. The most important review is the one that takes place before a test program begins. The QA Team works closely with technical division personnel to prepare and review test protocols. Test protocol review includes selection of appropriate test procedures, evaluation of interferences or other restrictions that might preclude use of standard test procedures, and evaluation and/or development of alternate procedures.

Equipment Calibration and Maintenance

The equipment used to conduct the emission measurements is maintained according to the manufacturer's instructions to ensure proper operation. In addition to the maintenance program, calibrations are carried out on each measurement device according to the schedule outlined by the Environmental Protection Agency. Quality control checks are also conducted in the field for each test program. In conformance with ASTM D7036 Section 15.3.15, all metering and monitoring equipment meets or exceeds the uncertainty criteria contained in the method language that pertains to that equipment.

Chain-of-Custody

Air Hygiene maintains full chain-of-custody documentation on all samples and data sheets. In addition to normal documentation of changes between field sample custodians, laboratory personnel, and field test personnel, Air Hygiene documents every individual who handles any test component in the field (e.g., probe wash, impinger loading and recovery, filter loading and recovery, etc.). Samples are stored in a locked area to which only Air Hygiene personnel have access. Field data sheets are secured at Air Hygiene's offices upon return from the field.

Training

Personnel's training is essential to ensure quality testing. Air Hygiene has formal and informal training programs, which include:

1. Attendance at EPA-sponsored training courses
2. Enrollment in EPA correspondence courses
3 A requirement for all technicians to read and understand Air Hygiene's QA manual
4. In-house training and QA meetings on a regular basis
5. Maintenance of training records

Knowledge of Current Test Methods

With the constant updating of standard test methods and the wide variety of emerging test procedures, it is essential that any qualified source tester keep abreast of new developments. Air Hygiene subscribes to services, which provide updates on EPA reference methods, rules, and regulations. Additionally, source test personnel regularly attend and present papers at testing and emission-related seminars and conferences. Air Hygiene personnel maintain membership in the Air and Waste Management Association and the American Industrial Hygiene Association.

Reproduction and Distribution Policy

Reproducing portions of this test report may omit critical or substantial documentation or be taken out of context and due care must be exercised in this regard. Furthermore, this test report and its associated data shall not be reproduced in full or in part without the written consent of the customer.

Data Provided by Client

Data provided by the Client is clearly identified in the report. Air Hygiene accepts data provided by the Client as accurate.

COMBUSTION TESTING QUALITY ASSURANCE ACTIVITIES

In conformance with ASTM D7036 Section 15.3.11 and 13, all testing was performed without any real or apparent errors, with the exception of those that would be listed in Section 2.0 of this report. In addition, all testing was conducted according to the approved testing protocol, test methods, Air Hygiene Quality Manual, or ASTM D7036, with the exception of specifics noted in Section 2.0 of this report. A number of quality assurance activities were undertaken before, during, and after this testing project. This section of the report combined with the documentation in Appendix C describes each of those activities.

Each instrument's response was checked and adjusted in the field prior to the collection of data via multi-point calibration. The instrument's linearity was checked by adjusting its zero and span responses to zero nitrogen and an upscale calibration gas in the range of the expected concentrations. The instrument response was then challenged with other calibration gases of known concentration and accepted as being linear if the response of the other calibration gases agreed within plus or minus two percent of the range of predicted values. NO_2 to NO conversion was checked via direct connect with an EPA Protocol certified concentration of NO_2 in a balance of air or nitrogen. Conversion was verified to be between 90 and 110 percent.

After each test run, the analyzers were checked for zero and span drift. This allowed each test run to be bracketed by calibrations and documents the precision of the data just collected. The criterion for acceptable data is that the instrument drift is no more than three percent of the full-scale response. The quality assurance worksheets in the following pages summarize all multipoint calibration checks and zero to span checks performed during the tests. These worksheets (as prepared from the data records of Appendix A) show that no drifts in excess of three percent occurred in the zero to span checks following each test run.

The sampling systems were leak checked by demonstrating that a vacuum greater than 10 in Hg could be held for at least one minute with a decline of less than one inch of Hg. A leak test was conducted after the sample system was set up and before the system was dismantled. This test was conducted to ensure that ambient air had not diluted the sample. Any leakage detected prior to the tests would be repaired and another leak check conducted before testing commenced. No leaks were found during the pre or post-test leak checks.

The absence of leaks in the sampling system was also verified by a sampling system bias check. The sampling system's integrity was tested by comparing the responses of the analyzers to the calibration gases introduced via two paths. The first path was directly into the analyzer and the second path via the sample system at the sample probe. Any difference in the instrument responses by these two methods was attributed to sampling system bias or leakage. The criterion for acceptance is agreement within five percent of the span of the analyzer.

The control gases used to calibrate the instruments were analyzed and certified by the compressed gas vendors to plus or minus one percent accuracy for all gases. EPA Protocol No. 1 was used, where applicable to assign the concentration values traceable to the National Institute of Standards and Technology (NIST), Standard Reference Materials (SRM's). The gas calibration sheets as prepared by the vendor are contained in Appendix C.

Air Hygiene collected and reported the enclosed test data in accordance with the procedures and quality assurance activities described in this test report. Air Hygiene makes no warranty as to the suitability of the test methods. Air Hygiene also assumes no liability relating to the interpretation and use of the test data.

Accredited Laboratory

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

Broken Arrow, OK

for technical competence in the field of

Environmental Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 *General requirements for the competence of testing and calibration laboratories*. This laboratory also meets the A2LA *R219 – Specific Requirements – TNI Field Sampling and Measurement Organization Accreditation Program*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (*refer to joint ISO-ILAC-IAF Communiqué dated April 2017*).

Presented this 18th day of December 2019

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.01
Valid to August 31, 2021

For the tests to which this accreditation applies, please refer to the laboratory's Envrionmental Scope of Accreditation.

STAC
STACK TESTING ACCREDITATION COUNCIL

A2LA
American Association for Laboratory Accreditation

Accredited Air Emission Testing Body

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

In recognition of the successful completion of the joint A2LA and Stack Testing Accreditation Council (STAC) evaluation process, this laboratory is accredited to perform testing activities in compliance with ASTM D7036:2004 - Standard Practice for Competence of Air Emission Testing Bodies.

Presented this 18th day of December 2019.

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.02
Valid to August 31, 2021

This accreditation program is not included under the A2LA ILAC Mutual Recognition Arrangement.

SOURCE EVALUATION SOCIETY

Qualified Source Testing Individual

LET IT BE KNOWN THAT

MATTHEW S. McBRIDE

HAS SUCCESSFULLY PASSED A COMPREHENSIVE EXAMINATION AND SATISFIED EXPERIENCE REQUIREMENTS IN ACCORDANCE WITH THE GUIDELINES ISSUED BY THE SES QUALIFIED SOURCE TEST INDIVIDUAL REVIEW BOARD FOR

GASEOUS POLLUTANTS INSTRUMENTAL SAMPLING METHODS

ISSUED THIS 27TH DAY OF JANAURY 2019 AND EFFECTIVE UNTIL JANUARY 26TH, 2024

NOx Converter Efficiency

Date: February 25, 2020

Analyzer: INST-NX-0031

RM 7E, (02-27-14), Sections 7.1.4; 8.2.4.1; 12.7; and 13.5 Introduce NO_2 to the analyzer and record the NOx concentration displayed. ... Calculate the converter efficiency using Equation 7E-7. The specification for converter efficiency must be met. ... Air Hygiene also references ALT-0013 for specific NO_2 concentration (40-60 ppm) and EPA Traceability Protocol requirements (±2%).

Audit Gas:	NO_2 Concentration (C_v), ppmvd	**48.70**
Converter Efficiency Calculations:		
	Analyzer Reading, NO Channel, ppmvd	**1.40**
	Analyzer Reading, NOx Channel, ppmvd	**48.79**
	Analyzer Reading, NO_2 Channel ($C_{Dir(NO2)}$), ppmvd	**47.39**
	Converter Efficiency, %	**97.31**

RM 7E, (02-27-14), 13.5 NO_2 to NO Conversion Efficiency Test (as applicable). The NO_2 to NO conversion efficiency, calculated according to Equation 7E-7, must be greater than or equal to 90 percent.

$$Eff_{NO2} = \left(\frac{C_{Dir}}{C_V}\right) \times 100$$

Eq. 7E-7 = $\frac{47.39 \text{ ppmvd}}{48.70 \text{ ppmvd}}$ x 100 = 97.31%

RATA - FIELD DATA SHEET

AIR HYGIENE

Company:	CIS
Location:	Cricket Valley
Date:	2/25/20 Project Code: 20-CIS-A-CricketValley
Unit Make and Model:	7F-05
Unit Number:	U-00002
Serial Number:	
Data Recorded By:	MA
Tested With AHI Unit(s):	Truck(s): 176 Trailer(s): 215
LDEQ Warmup/Cal Req:	On (Day/Time): 2/25/20 Cal (Day/Time): 5:00

Stack Dia. = 228
Measured By: RW
Measured With: Laser

General Electric, 7F.05, Unit #U-00002 CEMS
Cricket Valley Energy Center LLC
Cricket Valley Energy Center
Dover Plains, New York
February 25, 2020

1.0 INTRODUCTION

Air Hygiene International, Inc. (Air Hygiene) has completed the Relative Accuracy Test Audit (RATA) for nitrogen oxides (NOx), carbon monoxide (CO), ammonia (NH_3), and oxygen (O_2) from the exhaust of the General Electric, 7F.05, Unit #U-00002 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. This report details the background, results, process description, and the sampling/analysis methodology of the stack sampling survey conducted on February 25, 2020.

The accumulated data from the RATA provides the figures for evaluating the acceptability of the operation of the on-site continuous emission monitoring system (CEMS) for the monitoring of NOx, CO, NH_3, and O_2 from the General Electric, 7F.05, Unit #U-00002 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York.

1.1 TEST PURPOSE AND OBJECTIVES

The purpose of the test was to perform the initial certification RATA on the CEMS that serves the General Electric, 7F.05, Unit #U-00002 for Cricket Valley Energy Center LLC at the Cricket Valley Energy Center in Dover Plains, New York. Reference method (RM) testing followed the Code of Federal Regulations (CFR), Title 40 (40 CFR), Part 60 (40 CFR 60), Appendix A, Methods 1, 3A, 7E, 10, 19; and 40 CFR 63, Appendix A, Method 320. RM values are compared with the on-site CEMS to document performance as required in the 40 CFR 60, Appendix B, Performance Specifications (PS) and 40 CFR 75 Appendix A and B. All relative accuracies were established on-site and were governed by the following sets of rules:

In accordance with 40 CFR 60, Appendix B, PS 2, Section 13.2, the NOx and NH_3 RATA results are acceptable if the relative accuracy (RA) does not exceed 20.0 percent when average emissions during the test are greater than 50 percent of the emission standard or alternative relative accuracy (ARA) does not exceed 10.0 percent when the average emissions during the test are less than 50 percent of the emission standard. Part 60 further requires that the unit be operating at greater than 50 percent of normal load.

In accordance with 40 CFR 75, Appendix A, Section 3.3.2(a) and (b), the NOx RATA results are acceptable if the relative accuracy (RA) does not exceed 10.0 percent or if during the RATA the average NOx emission rate is less than or equal to 0.200 lb/MMBtu and the average difference between the CEMS and reference method (RM) values does not exceed 0.020 lb/MMBtu. Passing this set of criteria requires the CEMS to be retested after no more than two operating quarters. Alternatively, in accordance with 40 CFR 75, Appendix B, Section 2.3.1.2(a) and (f), and Appendix B, Figure 2, the NOx RATA results are acceptable if the RA does not exceed 7.5 percent or if during the RATA the average NOx emission rate is less than or equal to 0.200 lb/MMBtu and the average difference between the CEMS and RM values does not exceed 0.015 lb/MMBtu. Passing this set of criteria allows the CEMS to be retested after four operating quarters or at least within eight calendar quarters.

In accordance with 40 CFR 60, Appendix B, PS 3, Section 13.2, the O_2 RATA results are acceptable if the relative accuracy (RA) does not exceed 20.0 percent or if the average difference between the CEMS and reference method (RM) values does not exceed plus or minus 1.0 percent of the measured value.

In accordance with 40 CFR 60, Appendix B, PS 4 and 4A, Sections 13.2 of each, the CO relative accuracy (RA) test results are acceptable if the RA does not exceed 10.0 percent, if the average difference between the CEMS and reference method (RM) values plus the 2.5 percent confidence coefficient (2.5%CC) does not exceed 5.0 parts per million (ppm), or if the alternative relative accuracy (ARA) does not exceed 5.0 percent. Part 60 further requires that the unit be operating at greater than 50 percent of normal load.

1.2 SUMMARY OF TEST PROGRAM

The following list details pertinent information related to this specific project:

1.2.1 Participating Organizations
- New York State Department of Environmental Conservation (NYSDEC)
- Cricket Valley Energy Center LLC
- Custom Instrumentation Services Corporation (CiSCO)
- Bechtel
- Air Hygiene

1.2.2 Industry
- Electric Utility / Electric Services

1.2.3 Air Permit and Federal Requirements
- Permit Number: 3-1326-00275/00009
- DEC ID: 3132600275
- 40 CFR 60, Appendix B, Performance Specifications (PS)
- 40 CFR 75, Appendix A and B

1.2.4 Plant Location
- Cricket Valley Energy Center in Dover Plains, New York
  - GPS Coordinates [Latitude 41.67616, Longitude -73.576914]
  - 2241 Route NY 22, Dover Plains, New York 12522
  - Federal Registry System / Facility Registry Service (FRS) No. – 110043333372
  - Source Classification Code (SCC) – 20100209

1.2.5 Equipment Tested
- General Electric, 7F.05, Unit #U-00002
  - NOx Analyzer (TAPI T200M, Serial No. 1013)
  - NH_3 Analyzer (TAPI T200M, Serial No. 1048)
  - CO Analyzer (TAPI T300M, Serial No. 519)
  - O_2 Analyzer (TAPI T803, Serial No. 129)

1.2.6 Emission Points
- Exhaust from the General Electric, 7F.05, Unit #U-00002
- For all gases, one sample point in the exhaust duct from the General Electric, 7F.05, Unit #U-00002, determined after conducting a stratification test

1.2.7 Emission Parameters Measured
- NOx
- CO
- NH_3
- O_2

1.2.8 Date of Emission Test
- February 25, 2020

1.2.9 Federal Certifications

- Stack Testing Accreditation Council AETB Certificate No. 3796.02
- International Standard ISO/IEC 17025:2005 Certificate No. 3796.01

2.0 SUMMARY OF TEST RESULTS

Results from the sampling conducted on Cricket Valley Energy Center LLC's General Electric, 7F.05, Unit #U-00002 located at the Cricket Valley Energy Center on February 25, 2020 are summarized in the following table and relate only to the items tested.

TABLE 2.1
SUMMARY OF GENERAL ELECTRIC, 7F.05, UNIT #U-00002 RATA RESULTS

Pollutant	Units	Criteria			Results	Passed / Test Frequency
		CFR	Specification / Section	Standard		
NOx	ppmvd@15%O_2	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 7.84%	YES / ANNUAL
NOx	lb/hr	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 7.32%	YES / ANNUAL
NOx	lb/MMBtu	Part 75	Appendix A, Section 3.3.2(a),(b) Appendix B, Section 2.3.1.2(a),(f), Figure 2	RA ≤ 10%, or if lb/MMBtu ≤ 0.200, d ≤ ±0.020 lb/MMBtu Annual Incentive RA ≤ 7.5%, or if lb/MMBtu ≤ 0.2, d ≤ ±0.015 lb/MMBtu	RA = 7.88% RM = 0.01 lb/MMBtu d = 0.000 lb/MMBtu BAF=1.000	YES / ANNUAL
O_2	%vd	Part 60	Appendix B, Performance Specification 3, Section 13.2	RA ≤ 20%, or d ≤ ±1.0%	RA = 1.70% d = 0.2 %	YES / ANNUAL
CO	ppmvd@15%O_2	Part 60	Appendix B, Performance Specification 4, 4A, from all Section 13.2	RA ≤ 10%, or d + 2.5% CC ≤ ±5 ppmv, or ARA ≤ 5%	RA = 87.96% |d|+2.5%CC = 0.1 ppm	YES / ANNUAL
CO	lb/hr	Part 60	Appendix B, Performance Specification 4, 4A Section 13.2	RA ≤ 10%, or d + 2.5% CC ≤ ±5 lb/hr, or ARA ≤ 5%	RA = 98.88% |d|+2.5%CC = 0.1 ppm (|d|+2.5%CC = 0.7 lb/hr)	YES / ANNUAL
NH_3	ppmvd@15%O_2	Assumed Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	ARA = 4.38%	YES / ANNUAL
NH_3	lb/hr	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	ARA = 6.50%	YES / ANNUAL
Load	MW	Part 60	Appendix B, Performance Specifications	> 50% max load	354.2	WITHIN TOLERANCE
Load	MW	Part 75	Appendix A and B	normal load range	354.2	WITHIN TOLERANCE

Notes: RA = relative accuracy, ARA = alternative relative accuracy, RM = reference method value, d = difference between RM and CEMS value, CC = confidence coefficient, v = velocity, BAF = bias adjustment factor

The RATA passed for all pollutants (NOx, CO, NH_3, and O_2) in all units (ppm@15%O_2, lb/hr, lb/MMBtu, and %) under all 40 CFR 60 and 40 CFR 75 criteria.

Specifically, NOx in units of ppm@15%O_2 and lb/hr, passed 40 CFR 60 criteria with an RA less than 20 percent. NOx in units of lb/MMBtu passed the 40 CFR 75 alternative annual incentive criteria with an emissions rate of less than 0.200 lb/MMBtu and a difference between the RM and CEMS analyzers of less than 0.015 lb/MMBtu. Also the Bias Adjustment Factor test resulted in an adjustment factor equal to 1.0 (no adjustment required). O_2 in units of % passed the 40 CFR 60 criteria with an RA less than 20 percent. CO in units of ppm@15%O_2 and lb/hr passed the 40 CFR 60 alternative criteria with a concentration difference between the RM and CEMS analyzers plus the confidence coefficient of less than 5 ppm and 5 lb/hr respectively. NH_3 in units of ppm@15%O_2 and lb/hr passed the 40 CFR 60 criteria with an RA less than 20 percent.

Unit load was within the 40 CFR 60 required criteria of greater than 50 percent of the maximum load and also fell within the normal load criteria as defined by the plants Quality Control and Monitoring Plan which defined the upper and lower boundary on the unit and the normal and secondary normal load ranges.

The results of all measured pollutant emissions were below the required limits. All testing was performed without any real or apparent errors. All testing was conducted according to the approved testing protocol.

3.0 SOURCE OPERATION

3.1 PROCESS DESCRIPTION

Cricket Valley Energy Center LLC (CVEC) owns and operates the Cricket Valley Energy Center located at 2241 ST RTE 22 in Dover Plains, New York. Located on the Cricket Valley Energy Center are three General Electric (GE) 7F.05 Combustion Turbine Generators (CTGs), designated as U-00001, U-00002, and U-0003, and each unit is equipped with one heat recovery steam generator (HRSG) with supplemental duct firing. Each unit is rated at 381 megawatts (MW). The nominal MW per unit as per the NYSDEC Permit ID 3-1326-00275/00009 is identified as 333 MW.

A single, dedicated dry extraction based continuous emissions monitoring system (CEMS) is installed on each unit. The CEMS configurations include nitrogen oxide (NOx) analyzers, ammonia (NH_3) analyzers, carbon monoxide (CO) analyzers, diluent gas oxygen (O_2) analyzers, and data acquisition and handling systems (DAHS).

3.2 SAMPLING LOCATION

The CTG stack is vertical, circular, and measures 19 feet (ft) (228 inches) in diameter at the test ports which are approximately 265.8 ft above grade level with an exit elevation of approximately 282.5 ft above grade level. The test ports are located approximately 70.8 ft (850 inches) downstream and approximately 16.7 ft (200.4 inches) upstream from the nearest disturbances. Air Hygiene has field verified the measurable dimensions. Non-field verified dimensions are provided by Cricket Valley Energy Center LLC. All exhaust samples for gaseous emissions were continuously drawn from the exhaust system at the sample ports from a single point determined after conducting a stratification test. During the stratification test three points were traversed from each of the four ports. The probe was allowed to remain at a point for two times the system response time.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

4.1 TEST METHODS

The emission test on the General Electric, 7F.05, Unit #U-00002 at the Cricket Valley Energy Center was performed following United States Environmental Protection Agency (EPA) methods described by the Code of Federal Regulations (CFR). Table 4.1 outlines the specific methods performed on February 25, 2020.

TABLE 4.1
SUMMARY OF SAMPLING METHODS

Pollutant or Parameter	Sampling Method	Analysis Method
Sample Point Location	EPA Method 1	Equal Area Method
Oxygen	EPA Method 3A	Paramagnetic Cell
Nitrogen Oxides	EPA Method 7E	Chemiluminescent Analyzer
Carbon Monoxide	EPA Method 10	Nondispersive Infrared Analyzer
Stack Flow Rate	EPA Method 19	Dry Oxygen F Factor
Ammonia and Moisture	EPA Method 320	Fourier Transform Infrared

4.2 INSTRUMENT CONFIGURATION AND OPERATIONS FOR GAS ANALYSIS

The sampling and analysis procedures used during these tests conform with the methods outlined in the Code of Federal Regulations (CFR), Title 40, Part 60, Appendix A, Methods 1, 3A, 7E, 10, 19; and 40 CFR 63, Appendix A, Method 320.

Figure 4.1 depicts the sample system used for the real-time gas analyzer tests. The gas sample was continuously pulled through the probe and transported, via heat-traced Teflon® tubing, to a heated head pump and into the FTIR then to a stainless steel minimum-contact condenser designed to dry the sample. Transportation of the sample, through Teflon® tubing, continued into the sample manifold within the mobile laboratory / portable analyzer via a stainless steel/Teflon® diaphragm pump. From the manifold, the sample was partitioned to the real-time analyzers through rotameters that controlled the flow rate of the sample.

Figure 4.1 shows that the sample system was also equipped with a separate path through which a calibration gas could be delivered to the probe and back through the entire sampling system. This allowed for convenient performance of system bias checks as required by the testing methods.

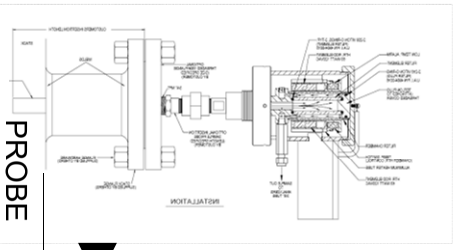
All instruments were housed in a climate controlled, trailer-mounted mobile laboratory. Gaseous calibration standards were provided in aluminum cylinders with the concentrations certified by the vendor. EPA Protocol No. 1 was used to determine the cylinder concentrations where applicable (i.e. NOx calibration gases).

Table 4.2 provides a description of the analyzers used for the instrument portion of the tests. All data from the continuous monitoring instruments were recorded on a Logic Beach Portable Data Logging System which retrieves calibrated electronic data from each instrument every one second and reports an average of the collected data every 30 seconds. For target compounds measured with the Fourier transform infrared (FTIR) spectrometer, interferograms consisting of 28 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations. Spectral data was analyzed by the MKS MG2000 software.

Eleven test runs of approximately 21 minutes each were conducted on the General Electric, 7F.05, Unit #U-00002 for NOx, CO, NH_3, and O_2.

The stack gas analysis for O_2 concentrations was performed in accordance with procedures set forth in EPA Method 3A. The O_2 analyzer uses a paramagnetic cell detector.

EPA Method 7E was used to determine concentrations of NOx. A chemiluminescent analyzer was used to determine the nitrogen oxides concentration in the gas stream. A NO_2 in nitrogen certified gas cylinder was used to verify at least a 90 percent NO_2 conversion on the day of the test.



CO emission concentrations were quantified in accordance with procedures set forth in EPA Method 10. A continuous nondispersive infrared (NDIR) analyzer was used for this purpose.

An MKS Instruments - MultiGas™ Fourier Transform Infrared (FTIR) spectrometer, or equivalent, was used for NH_3 and H_2O analysis per EPA Method 320. The FTIR spectrometer spectral resolution was 0.5 cm^{-1}. The system employed a silicon carbide infrared source at 1200ºC, a helium neon reference laser, beam splitters, potassium bromide (KBr) cell window, front-surface optical transfer mirrors, and multi-pass absorption cells. MCT detectors were used and cooled with liquid nitrogen in order to maintain a constant temperature of 77 Kelvin. The approximately 5.11-meter multi-pass path cells incorporated aspheric, aberration-correcting mirrors to increase the optical throughput and the detection sensitivity. Transducers and thermocouples were connected directly to the insulated sample cells that provide the pressure and temperatures of the sample streams. During testing, the temperature of the absorption cells was set at 191ºC. Elevated temperature prevented gas condensation within the cell and minimized compound adhesion to the cell walls and mirrors. The volume of the absorption cell was 0.5 liters, so at a sample gas flow rate of 4.0 liters per minute, the sample gas in the cell is refreshed approximately four times each minute. Interferograms consisting of 28 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations.

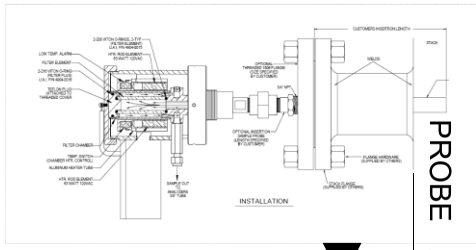


TABLE 4.2
ANALYTICAL INSTRUMENTATION

Parameter	Manufacturer and Model	Range	Sensitivity	Detection Principle
NOx	THERMO 42 series	User may select up to 5,000 ppm	0.1 ppm	Thermal reduction of NO_2 to NO. Chemiluminescence of reaction of NO with O_3. Detection by PMT. Inherently linear for listed ranges.
CO	THERMO 48 series	User may select up to 10,000 ppm	0.1 ppm	Infrared absorption, gas filter correlation detector, microprocessor based linearization.
NH_3 and H_2O	MKS 2030	User may select from multiple ranges	0.1 ppm	Fourier Transform Infrared – FTIR
O_2	SERVOMEX 1440	0-25%	0.1%	Paramagnetic cell, inherently linear.

Part 60, Appendix B, Performance Specification 4,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS having span values of 1,000 ppmv CO.
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA or 5 percent when the applicable emission standard (permit limit) is used to calculate RA.

Part 60, Appendix B, Performance Specification 4A,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS that comply with low emission standards (less than 200 ppmv).
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA, 5 percent when the applicable emission standard (permit limit) is used to calculate RA, or within 5 ppmv when the RA is calculated as the absolute average difference between the RM and CEMS plus the 2.5 percent confidence coefficient.

Part 60, Appendix B, Performance Specification 4,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS having span values of 1,000 ppmv CO.
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA or 5 percent when the applicable emission standard (permit limit) is used to calculate RA.

Part 60, Appendix B, Performance Specification 4A,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS that comply with low emission standards (less than 200 ppmv).
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA, 5 percent when the applicable emission standard (permit limit) is used to calculate RA, or within 5 ppmv when the RA is calculated as the absolute average difference between the RM and CEMS plus the 2.5 percent confidence coefficient.

Standard Deviation	0.0001
T-value	2.306
Confidence Coefficient	0.0001

Relative Accuracy = 7.88%

If the mean difference is less than or equal to the absolute value of the confidence coefficient, then the Bias Test passes and the bias adjustment factor is not applicable.

Mean Difference =	-0.0004
Confidence Coefficient =	0.0001

BAF = 1 + (abs. value mean difference/avg. CEMS reading)

Average CEMS Reading =	0.0062
BAF =	**1.000**

Part 75, Appendix A,
3.3.2 Relative Accuracy for NOX-Diluent Continuous Emission Monitoring Systems
(a) The relative accuracy for NOX-diluent continuous emission monitoring systems shall not exceed 10.0 percent.
(b) For affected units where the average of the reference method measurements of NOX emission rate (this means lb/MMBtu) during the relative accuracy test audit is less than or equal to 0.200 lb/mmBtu, the difference between the mean value of the continuous emission monitoring system measurements and the reference method mean value shall not exceed ±0.020 lb/mmBtu, wherever the relative accuracy specification of 10.0 percent is not achieved.

7.6.5 Bias Adjustment
(b) For single-load RATAs of SO2 pollutant concentration monitors, NOX concentration monitoring systems, and NOX-diluent monitoring systems and for the single-load flow RATAs required or allowed under section 6.5.2 of this appendix and sections 2.3.1.3(b) and 2.3.1.3(c) of Appendix B to this part, the appropriate BAF is determined directly from the RATA results at normal load, using Equation A-12. Notwithstanding, when a NOX concentration CEMS or an SO2 CEMS or a NOX-diluent CEMS installed on a low-emitting affected unit (i.e., average SO2 or NOX concentration during the RATA &IE; 250 ppm or average NOX emission rate &IE; 0.200 lb/mmBtu) meets the normal 10.0 percent relative accuracy specification (as calculated using Equation A-10) or the alternate relative accuracy specification in section 3.3 of this appendix for low-emitters, but fails the bias test, the BAF may either be determined using Equation A-12, or a default BAF of 1.111 may be used.

Part 75, Appendix B,
2.3.1.2 Reduced RATA Frequencies. Relative accuracy test audits of primary and redundant backup SO2 pollutant concentration monitors, CO2 pollutant concentration monitors (including O2 monitors used to determine CO2 emissions), CO2 or O2 diluent monitors used to determine heat input, moisture monitoring systems, NOX concentration monitoring systems, flow monitors, NOX-diluent monitoring systems or SO2-diluent monitoring systems may be performed annually (i.e., once every four successive QA operating quarters, rather than once every two successive QA operating quarters) if any of the following conditions are met for the specific monitoring system involved:
(a) The relative accuracy during the audit of an SO2 or CO2 pollutant concentration monitor (including an O2 pollutant monitor used to measure CO2 using the procedures in appendix F to this part), or of a CO2 or O2 diluent monitor used to determine heat input, or of a NOX concentration monitoring system, or of a NOX-diluent monitoring system, or of an SO2-diluent continuous emissions monitoring system is ≤ 7.5 percent;

(f) For units with low NOX emission rates (average NOX emission rate measured by the reference method during the RATA ≤ 0.200 lb/mmBtu), when a NOX-diluent continuous emission monitoring system fails to achieve a relative accuracy ≤ 7.5 percent, but the monitoring system mean value from the RATA, calculated using Equation A-7 in appendix A to this part, is within ± 0.015 lb/mmBtu of the reference method mean value;

Figure 2 to Appendix B of Part 75_Relative Accuracy Test Frequency Incentive System.

RATA	Semiannual(percent)(1)	Annual(1)
SO2 or NOX(3)	7.5% < RA ≤ 10.0% or ± 15.0 ppm(2)	RA ≤ 7.5% or ± 12.0 ppm(2)
SO2-diluent	7.5% < RA ≤ 10.0% or ± 0.030 lb/mmBtu(2)	RA ≤ 7.5% or ± 0.025 lb/mmBtu(2)
NOX-diluent	7.5% < RA ≤ 10.0% or ± 0.020 lb/mmBtu(2)	RA ≤ 7.5% or ± 0.015 lb/mmBtu(2)
Flow	7.5% < RA ≤ 10.0% or ± 2.0 fps(2)	RA ≤ 7.5% or ± 1.5 fps
CO2 or O2	7.5% < RA ≤ 10.0% or ± 1.0% CO2/O2(2)	RA ≤ 7.5% or ± 0.7% CO2/O2(2)
Moisture	7.5% < RA ≤ 10.0% or ± 1.5% H2O(2)	RA ≤ 7.5% or ± 1.0% H2O(2)

(1) The deadline for the next RATA is the end of the second (if semiannual) or fourth (if annual) successive QA operating quarter following the quarter in which the CEMS was last tested. Exclude calendar quarters with fewer than 168 unit operating hours (or, for common stacks and bypass stacks, exclude quarters with fewer than 168 stack operating hours) in determining the RATA deadline. For SO2 monitors, QA operating quarters in which only very low sulfur fuel as defined in § 72.2, is combusted may also be excluded. However, the exclusion of calendar quarters is limited as follows: the deadline for the next RATA shall be no more than 8 calendar quarters after the quarter in which a RATA was last performed.
(2) The difference between monitor and reference method mean values applies to moisture monitors, CO2, and O2 monitors, low emitters, or low flow, only.
(3) A NOX concentration monitoring system used to determine NOX mass emissions under § 75.71.

Calculations, Formulas, and Constants

The following information supports the spreadsheets for this testing project.

Given Data:

Ideal Gas Conversion Factor = 385.23 SCF/lb-mol at 68 deg F & 14.696 psia

Fuel Heating Value is based upon Air Hygiene's fuel gas calculation sheet. All calculations are based upon a correction to 68 deg F & 14.696 psia

High Heating Values (HHV) are used for the Fuel Heating Value, F-Factor, and Fuel Flow Data per EPA requirements.

ASTM D 3588

Molecular Weight of NOx (lb/lb-mole) =	46.01
Molecular Weight of CO (lb/lb-mole) =	28.00
Molecular Weight of SO_2 (lb/lb-mole) =	64.00
Molecular Weight of THC (propane) (lb/lb-mole) =	44.00
Molecular Weight of VOC (methane) (lb/lb-mole) =	16.00
Molecular Weight of NH_3 (lb/lb-mole) =	17.03
Molecular Weight of HCHO (lb/lb-mole) =	30.03
Molecular Weight of CO_2 (lb/lb-mole) =	44.01

40CFR60, App. A., RM 19, Table 19-1

Conversion Constant for NOx =	0.0000001194351
Conversion Constant for CO =	0.0000000726839
Conversion Constant for SO_2 =	0.0000001661345
Conversion Constant for THC =	0.0000001142175
Conversion Constant for VOC (methane) =	0.0000000415336
Conversion Constant for NH_3 =	0.0000000442074
Conversion Constant for HCHO =	0.0000000779534
Conversion Constant for CO_2 =	0.0000001142434

NOTE: units are lb/ppm*ft^3

Formulas:

1. Corrected Raw Average (C_{Gas}), 40CFR60, App. A, RM 7E, Eq. 7E-5 (08/15/06)

$$C_{Gas} = (C_{Avg} - C_O) \times \left(\frac{C_{MA}}{C_M - C_O} \right)$$

2. Correction to % O_2, 40CFR60, App. A, RM 20, Eq. 20-5 (11/26/02)

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}} \right)$$

3. Correction to % O_2 and ISO Conditions

$$C_{ISO} = C_{Adj} \times \sqrt{\frac{P_r}{P_o}} \times e^{(19 \times (H_O - 0.00633))} \times \left(\frac{288}{T_a} \right)^{1.53}$$

4. Method 19 stack exhaust flow (scfh) [ref. EPA EMC FAQ Method 19]

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000} \right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}} \right)$$

5. Emission Rate in lb/hr

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

6. Emission Rate in tons per year

$$E_{ton/yr} = \frac{E_{lb/hr} \times hr_{year}}{2000}$$

7. Emission Concentration in lb/MMBtu (O_2 based)

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$

8. Emission Concentration in g/hp*hr

$$E_{g/hp \cdot hr} = \frac{E_{lb/hr} \times 453.6}{mw \times 1341.022} or \frac{E_{lb/hr} \times 453.6}{hp}$$

RATA SHEET CALCULATIONS

d = Reference Method Data - CEMS Data

S_d = Standard Deviation

CC = Confident Coefficient

n = number of runs

$t_{0.025}$ = 2.5 percent confidence coefficient T-values

RA = relative accuracy

ARA = alternative relative accuracy

BAF = Bias adjustment factor

n	t	n	t	n	t
2	12.706	7	2.447	12	2.201
3	4.303	8	2.365	13	2.179
4	3.182	9	2.306	14	2.160
5	2.776	10	2.262	15	2.145
6	2.571	11	2.228	16	2.131

1. Difference

$$d = \sum_{i=1}^{n} d_i$$

2. Standard Deviation

$$S_d = \sqrt{\frac{\sum_{i=1}^{n} d_i^2 - \left[\frac{\left(\sum_{i=1}^{n} d_i \right)^2}{n} \right]}{n-1}}$$

3. Confident Coefficient

$$CC = t_{0.025} \times \frac{S_d}{\sqrt{n}}$$

4. Relative Accuracy

$$RA = \frac{|d_{AVG}| + |CC|}{RM_{AVG}} \times 100$$

5. Alternative Relative Accuracy

$$ARA = \frac{|d_{AVG}| + |CC|}{AS} \times 100$$

5. Bias Adjustment Factor

$$BAF = 1 + \left(\frac{|d_{AVG}|}{CEM_{AVG}} \right)$$

RM 7E, (08-15-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

ACE = Analyzer calibration error, percent of calibration span.
B_{WS} = Moisture content of sample gas as measured by Method 4 or other approved method, percent/100.
C_{Avg} = Average unadjusted gas concentration indicated by data recorder for the test run.
C_D = Pollutant concentration adjusted to dry conditions.
C_{Dir} = Measured concentration of a calibration gas (low, mid, or high) when introduced in direct calibration mode.
C_{Gas} = Average effluent gas concentration adjusted for bias.
C_M = Average of initial and final system calibration bias (or 2-point system calibration error) check responses for the upscale calibration gas.
C_{MA} = Actual concentration of the upscale calibration gas, ppmv.
C_O = Average of the initial and final system calibration bias (or 2-point system calibration error) check responses from the low-level (or zero) calibration gas.
C_S = Measured concentration of a calibration gas (low, mid, or high) when introduced in system calibration mode.
C_{SS} = Concentration of NOx measured in the spiked sample.
C_{Spike} = Concentration of NOx in the undiluted spike gas.
C_{Calc} = Calculated concentration of NOx in the spike gas diluted in the sample.
C_V = Manufacturer certified concentration of a calibration gas (low, mid, or high).
C_W = Pollutant concentration measured under moist sample conditions, wet basis.
CS = Calibration span.
D = Drift assessment, percent of calibration span.
E_p = The predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response.
Eff_{NO2} = NO_2 to NO converter efficiency, percent.
H = High calibration gas, designator.
L = Low calibration gas, designator.
M = Mid calibration gas, designator.
NOFinal = The average NO concentration observed with the analyzer in the NO mode during the converter efficiency test in Section 16.2.2.
NOxCorr = The NOx concentration corrected for the converter efficiency.
NOxFinal = The final NOx concentration observed during the converter efficiency test in Section 16.2.2.
NOxPeak = The highest NOx concentration observed during the converter efficiency test in Section 16.2.2.
Q_{Spike} = Flow rate of spike gas introduced in system calibration mode, L/min.
Q_{Total} = Total sample flow rate during the spike test, L/min.
R = Spike recovery, percent.
SB = System bias, percent of calibration span.
SB_i = Pre-run system bias, percent of calibration span.
SB_f = Post-run system bias, percent of calibration span.
SB / D_{Alt} = Alternative absolute difference criteria to pass bias and/or drift checks.
SCE = System calibration error, percent of calibration span.
SCE_i = Pre-run system calibration error, percent of calibration span.
SCE_{final} = Post-run system calibration error, percent of calibration span.
Z = Zero calibration gas, designator.

40CFR60.355(b)(1), (09-20-06), Nomenclature. The terms used in the equations are defined as follows:

P_r = reference combustor inlet absolute pressure at 101.3 kilopascals ambient pressure, mm Hg
P_o = observed combustor inlet absolute pressure at test, mm Hg
H_o = observed humidity of ambient air, g H_2O/g air
e = transcendental constant, 2.718
T_a = ambient temperature, K

Small Engine and FTIR Nomenclature. The terms used in the equations are defined as follows:

bhp = brake horsepower
hp = horsepower
Q_{sys} = system flow (lpm)
Q_m = matrix spike flow (lpm)

RM 19, (07-29-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

AdjFactor = Percent oxygen or carbon dioxide adjustment applied to a target pollutant
B_{wa} = Moisture fraction of ambient air, percent.
Btu = British thermal unit
$\%_C$ = Concentration of carbon from an ultimate analysis of fuel, weight percent.
$\%_{CO2d}$,$\%_{CO2w}$ = Concentration of carbon dioxide on a dry and wet basis, respectively, percent.
CIP / CDP = Combustor inlet pressure / compressor discharge pressure (mm Hg); note, some manufactures reference as PCD.
E = Pollutant emission rate, ng/J (lb/million Btu).
E_a = Average pollutant rate for the specified performance test period, ng/J (lb/million Btu).
E_{ao}, E_{ai} = Average pollutant rate of the control device, outlet and inlet, respectively, for the performance test period, ng/J (lb/million Btu).
E_{bi} = Pollutant rate from the steam generating unit, ng/J (lb/million Btu).
E_{bo} = Pollutant emission rate from the steam generating unit, ng/J (lb/million Btu).
E_{ci} = Pollutant rate in combined effluent, ng/J (lb/million Btu).
E_{co} = Pollutant emission rate in combined effluent, ng/J (lb/million Btu).
E_d = Average pollutant rate for each sampling period (e.g.,24-hr Method 6B sample or 24-hr fuel sample) or for each fuel lot (e.g., amount of fuel bunkered), ng/J (lb/million Btu).
E_{di} = Average inlet SO_2 rate for each sampling period d, ng/J (lb/million Btu).
E_g = Pollutant rate from gas turbine, ng/J (lb/million Btu).
E_{ga} = Daily geometric average pollutant rate, ng/J (lbs/million Btu) or ppm corrected to 7 percent O_2.
E_{jo},E_{ji} = Matched pair hourly arithmetic average pollutant rate, outlet and inlet, respectively, ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
E_h = Hourly average pollutant, ng/J (lb/million Btu).
E_{hj} = Hourly arithmetic average pollutant rate for hour "j," ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
EXP = Natural logarithmic base (2.718) raised to the value enclosed by brackets.
Fc = Ratio of the volume of carbon dioxide produced to the gross calorific value of the fuel from Method 19
F_d, F_w, F_c = Volumes of combustion components per unit of heat content, scm/J (scf/million Btu).
ft^3 = cubic feet
G = ideal gas conversion factor
(385.23 SCF/lb-mol at 68 deg F & 14.696 psia)
GCM = gross Btu per SCF (constant, compound based)
GCV = Gross calorific value of the fuel consistent with the ultimate analysis, kJ/kg (Btu/lb).
GCV_p, GCV_r = Gross calorific value for the product and raw fuel lots, respectively, dry basis, kJ/kg (Btu/lb).
$\%_H$ = Concentration of hydrogen from an ultimate analysis of fuel, weight percent.
H_b = Heat input rate to the steam generating unit from fuels fired in the steam generating unit, J/hr (million Btu/hr).
H_g = Heat input rate to gas turbine from all fuels fired in the gas turbine, J/hr (million Btu/hr).
$\%_{H2O}$ = Concentration of water from an ultimate analysis of fuel, weight percent.
H_r = Total numbers of hours in the performance test period (e.g., 720 hours for 30-day performance test period).
K = volume of combustion component per pound of component (constant)
K = Conversion factor, 10^{-5} (kJ/J)/(%) [10^6 Btu/million Btu].
K_c = (9.57 scm/kg)/% [(1.53 scf/lb)/%].
K_{cc} = (2.0 scm/kg)/% [(0.321 scf/lb)/%].
K_{hd} = (22.7 scm/kg)/% [(3.64 scf/lb)/%].
K_{hw} = (34.74 scm/kg)/% [(5.57 scf/lb)/%].
K_n = (0.86 scm/kg)/% [(0.14 scf/lb)/%].
K_o = (2.85 scm/kg)/% [(0.46 scf/lb)/%].
K_s = (3.54 scm/kg)/% [(0.57 scf/lb)/%].
K_{sulfur} = $2x10^4$ Btu/wt%-MMBtu
K_w = (1.30 scm/kg)/% [(0.21 scf/lb)/%].
lb = pound
ln = Natural log of indicated value.
L_p,L_r = Weight of the product and raw fuel lots, respectively, metric ton (ton).
$\%_N$ = Concentration of nitrogen from an ultimate analysis of fuel, weight percent.
$M_{\%}$ = mole percent
mol = mole
MW = molecular weight (lb/lb-mol)
MW_{AIR} = molecular weight of air (28.9625 lb/lb-mole)[1]
NCM = net Btu per SCF (constant based on compound)
$\%_O$ = Concentration of oxygen from an ultimate analysis of fuel, weight percent.
$\%_{O2d}$, $\%_{O2w}$ = Concentration of oxygen on a dry and wet basis, respectively, percent.
P_B = barometric pressure, in Hg
P_s = Potential SO2 emissions, percent.
$\%_S$ = Sulfur content of as-fired fuel lot, dry basis, weight percent.
S_e = Standard deviation of the hourly average pollutant rates for each performance test period, ng/J (lb/million Btu).
$\%_{Sf}$ = Concentration of sulfur from an ultimate analysis of fuel, weight percent.
S(wt%) = weight percent of sulfur, per lab analysis by appropriate ASTM standard
S_i = Standard deviation of the hourly average inlet pollutant rates for each performance test period, ng/J (lb/million Btu).
S_o = Standard deviation of the hourly average emission rates for each performance test period, ng/J (lb/million Btu).
$\%S_p$, $\%S_r$ = Sulfur content of the product and raw fuel lots respectively, dry basis, weight percent.
SCF = standard cubic feet
SH = specific humidity, pounds of water per pound of air
$t_{0.95}$ = Values shown in Table 19-3 for the indicated number of data points n.
T_{amb} = ambient temperature, °F
W/D Factor = 1.0236 = conv. at 14.696 psia and
68 deg F (ref. Civil Eng. Ref. Manual, 7th Ed.)
X_{CO2}=CO_2 Correction factor, percent.
X_k = Fraction of total heat input from each type of fuel k.

EXAMPLE CALCULATIONS (INFORMATION)

Specific Humidity (RH_{sp})

Note: RHsp (gr/lb) calculated using temperature, relative humidity, and barometric pressure with psychrometric chart, psychrometric calculator, or built in psychrometric algorithm.

$$RH_{sp}(lb/lb) = \left[\left(\frac{gr}{lb}\right) \times \frac{lb}{7000\ gr}\right]$$

RH_{sp}= 32.23 gr / lb x 1 lb / 7000 gr = 0.004604 lb H_2O / lb Air

EXAMPLE CALCULATIONS (CALIBRATION)

Analyzer Calibration Error

RM 7E, (02-27-14), 12.2 Analyzer Calibration Error. For non-dilution systems, use Equation 7E-1 to calculate the analyzer calibration error for the low-, mid-, and high-level calibration gases. (calc for NOx analyzer mid gas, if applicable)

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100$$ Eq. 7E-1

ACE = (5.09 ppm - 4.91 ppm) / 9.20 ppm x 100 = 1.96 %

EXAMPLE CALCULATIONS (BIAS, DRIFT, AND CORRECTED RAW AVERAGE)

System Bias

RM 7E, (02-27-14), 12.3 System Bias. For non-dilution systems, use Equation 7E-2 to calculate the system bias separately for the low-level and upscale calibration gases. (calc for NOx analyzer upscale gas, Run 1 initial bias, if applicable)

$$SB = \left(\frac{C_S - C_{Dir}}{CS}\right) \times 100$$ Eq. 7E-2

SB = (4.93 ppm - 5.09 ppm) / 9.20 ppm x 100 = -1.74 %

Drift Assessment

RM 7E, (02-27-14), 12.5 Drift Assessment. Use Equation 7E-4 to separately calculate the low-level and upscale drift over each test run. (calc for NOx analyzer upscale drift, Run 1, if applicable)

$$D = \left|SB_{final} - SB_t\right|$$ Eq. 7E-4

D = | -2.83 % - -1.74 % | = 1.09 %

Alternative Drift and Bias

RM 7E, (02-27-14), 13.2 / 13.3 System Bias and Drift. Alternatively, the results are acceptable if |Cs – Cdir| is ≤ 0.5 ppmv or if |Cs – Cv| is ≤ 0.5 ppmv (as applicable). (calc for NOx analyzer initial upscale, Run 1, if applicable)

$$SB / D_{Alt} = \left|C_S - C_{Dir}\right|$$ Eq. Section 13.2 and 13.3

SB / D_{Alt} = | 4.93 ppm - 5.09 ppm | = 0.16 ppm

Bias Adjusted Average

RM 7E, (02-27-14), 12.6 Effluent Gas Concentration. For each test run, calculate Cavg, the arithmetic average of all valid NOx concentration values (e.g., 1-minute averages). Then adjust the value of Cavg for bias, using Equation 7E-5b. (calc for NOx analyzer, Run 1, if applicable)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$ Eq. 7E-5b

C_{Gas} = (1.85 ppm - -0.26 ppm) (4.91 ppm / 4.88 ppm - -0.26 ppm) = 2.02 ppm

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RUNS)

Stack Exhaust Flow (Q_S) - RM19

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000}\right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}}\right)$$

Note: Equation presented in EPA Emission Measurement Center (EMC), Frequently Asked Questions (FAQ) for Method 19

Q_S = 8,710.00 SCF/MMBtu x 2,317,550.00 SCF/hr x 1,050.00 Btu/SCF x MMBtu/10^6 Btu x [20.90% / (20.9% - 13.4 %)] = 58,713,359.00 SCFH

Moisture Correction

RM 7E, (02-27-14), 12.10 Moisture Correction. Use Equation 7E-10 if your measurements need to be corrected to a dry basis. (calc for NOx analyzer, Run 1, if applicable) Note: Calculations may not match as Run 1 results are typically also bias adjusted

$$C_W = C_D \times (1 - B_{WS})$$

$$C_D = \frac{C_W}{1 - B_{WS}}$$ Eq. 7E-10

C_D = 1.85 ppmvw / (1 - 0.08) = 2.02 ppmvd or inversely, C_W = 2.02 ppmvd x (1 - 0.08) = 1.85 ppmvw

Diluent-Corrected Pollutant Concentration, O_2 Based

RM 20, (11-26-02), 7.3.1 Correction of Pollutant Concentration Using O_2 Concentration. Calculate the O_2 corrected pollutant concentration, as follows: (calc for NOx gas, Run 1, if applicable) [now contained in applicable Subpart]

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}}\right)$$ Eq. 20-4

C_{adj} = 2.02 ppm x [(20.9% - 15.00 %) / (20.9% - 13.36 %)] = 1.58 ppm@15%O_2

Emissions Rate (lb/hr)

Calculation for pound per hour emission rate. Calculate, as follows: (calc for NOx gas Run 1, if applicable)

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

$E_{lb/hr}$ = 2.02 ppmvd / 10^6 ppm/part x 58,713,359 DSCFH x 46.01 lb/lb-mol / 385.23 SCF/lb-mol = 14.14 lb/hr

Emissions Rate (lb/MMBtu)

RM 19, (02-27-14), 12.2 Emission Rates of PM, SO_2, and NOx. Select from the following sections the applicable procedure to compute the PM, SO_2, or NOx emission rate (E) in ng/J (lb/million Btu). (calc for NOx gas Run 1, if applicable)

Oxygen Based

12.2.1 Oxygen-Based F Factor, Dry Basis. When measurements are on a dry basis for both O_2 ($\%O_2$d) and pollutant (Cd) concentrations, use the following equation:

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$ Eq. 19-1

$E_{lb/MMBtu}$ = 2.02 ppm x 8,710.00 SCF/MMBtu x 0.0000001194 lb/ppm*ft^3 x 20.9% / (20.9% - 13.36 %) = 0.006 lb/MMBtu

Conversion Constant

Convc for NOx

$$Conv_c(lb/ppm \cdot ft^3) = \frac{\frac{MW}{G}}{10^6}$$

$Conv_c$ = (46.01 lb/lb•mole x lb•mole/385.23 SCF) / 10^6 = 0.0000001194 lb/ppm-ft^3

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RATA RESULTS)

Difference (d)

40 CFR 75, App A, (12-17-09), 7.3.1 Arithmetic Mean. Calculate the arithmetic mean of the differences, d , of a data set as follows. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$d = \sum_{i=1}^{n} d_i$$ Eq. A-7

d = 0.006 lb/MMBtu - 0.006 lb/MMBtu = 0.000 lb/MMBtu

Standard Deviation

40 CFR 75, App A, (12-17-09), 7.3.2 Standard Deviation. Calculate the standard deviation, Sd, of a data set as follows:
(calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$S_d = \sqrt{\frac{\sum_{i=1}^{n} d_i^2 - \frac{\left[\left(\sum_{i=1}^{n} d_i\right)^2\right]}{n}}{n-1}}$$ Eq. A-8

$$S_d = \sqrt{\frac{0.000 \text{ lb/MMBtu}^2 - \frac{(-0.004 \text{ lb/MMBtu})^2}{9}}{9 - 1}} = 0.000 \text{ lb/MMBtu}$$

Confidence Coefficient

40 CFR 75, App A, (12-17-09), 7.3.3 Confidence Coefficient. Calculate the confidence coefficient (one-tailed), cc, of a data set as follows. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$CC = t_{0.025} \times \frac{S_d}{\sqrt{n}}$$ Eq. A-9

CC = 2.306 x $\frac{0.000 \text{ lb/MMBtu}}{\sqrt{9}}$ = 0.000 lb/MMBtu

T-Values	n	2	3	4	5	6	7	8	9
	$t_{0.025}$	12.706	4.303	3.182	2.776	2.571	2.447	2.365	2.306

2.5 percent confidence coefficients

Relative Accuracy

40 CFR 75, App A, (12-17-09), 7.3.4 Relative Accuracy. Calculate the relative accuracy of a data set using the following equation. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$RA = \frac{|d_{AVG}| + |CC|}{RM_{AVG}} \times 100$$ Eq. A-10

RA = $\frac{|0.000 \text{ lb/MMBtu}| + |0.000 \text{ lb/MMBtu}|}{0.006 \text{ lb/MMBtu}}$ x 100 = 7.88 %

Bias Adjustment Factor (BAF)

40 CFR 75, App A, (12-17-09), 7.6.5 Bias Adjustment. (a) If the monitor or monitoring system fails to meet the bias test requirement, adjust the value obtained from the monitor using the following equation: (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$BAF = 1 + \left(\frac{|d_{AVG}|}{CEM_{AVG}}\right)$$ Eq. A-12

d_{AVG}= 0.000 < |CC| = 0.000 ⇨ BAF = 1 + $\frac{|\quad| \text{ lb/MMBtu}}{\text{lb/MMBtu}}$ = 1.000 lb/MMBtu

Note: BAF only applies if the mean difference (d) is greater than the absolute value of the confidence coefficient.

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

APPENDIX B

CEMS AND REFERENCE METHOD DATA

Cricket Valley Energy Center LLC

Air Permit Number:	3-1326-00275/00009
Plant Name or Location:	Cricket Valley Energy Center

CERTIFICATE OF ANALYSIS
(Zero Ambient Nitrogen)

Cylinder Number:	EB0072934	**Certification Date:**	05/21/2019
Product ID Number:	121026	**Expiration Date:**	05/19/2027
Cylinder Pressure:	1900 PSIG	**MFG Facility:**	RBTGS-Shreveport-LA
COA #	EB0072934.20190521-0	**Lot Number:**	EB0072934.20190521
Customer PO. NO.:		**Tracking Number:**	084249399
Customer:		**Previous Certification Dates:**	

This mixture is for laboratory use only, not for drug, household or other use.
This mixture is certified in Mole % to be within ±2% of the actual number reported with a confidence of 95%.
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

Composing Material: Zero Ambient Nitrogen, Cert., Sz152

Component	Specification	Concentration
Nitrogen	Balance	Balance
Oxygen as Impurity	<1.0 PPM	<1.0 PPM
Carbon Dioxide as Impurity	<0.5 PPM	<0.5 PPM
Carbon Monoxide as Impurity	<0.5 PPM	<0.5 PPM
Total Oxides of Nitrogen as Impurity	<0.1 PPM	<0.1 PPM
Sulfur Dioxide as Impurity	<0.1 PPM	<0.1 PPM
Total Hydrocarbons as Impurity	<0.1 PPM	<0.1 PPM

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

APPENDIX D

QUALITY ASSURANCE AND QUALITY CONTROL DATA

QA/QC PROGRAM

AIR HYGIENE ensures the quality and validity of its emission measurement and reporting procedures through a rigorous quality assurance (QA) program. The program is developed and administered by an internal QA team and encompasses six major areas:

1. Field Qualifications
2. QA reviews of reports, laboratory work, and field testing;
3. Equipment calibration and maintenance;
4. Chain-of-custody;
5. Training; and
6. Knowledge of current test methods

Field Qualifications

Air Hygiene personnel are required to gain and maintain competence with testing methods and techniques according to their job titles and the roles they play during field testing events. Qualifications for each job description include:

Staff Technician - An entry level position with responsibility to test on the stack by performing duties that include: keep trucks and trailers stocked and clean, travel to and from job site, be the "hands of the test" on the stack; stay on a stack during the sample test, set up and tear down equipment on-site, perform maintenance on equipment in the shop and on-site.

Test Technician or Specialist - Acts as the "hands of the test" on the stack by performing duties that include: stay on a stack during the sample test, migrate to the testing trailer and learn the different analyzers and testing methods used on site, set up and tear down testing equipment on site, learn the system for testing from Testing Managers and Project Managers, travel to and from job site; including driving responsibilities under DOT requirements, follow directions of Testing Managers and Project Managers, learn the proper way to conduct on-site test of stationary stacks

Test Manager or Engineer - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Test Managers must hold at least one QSTI certificate.

Project Manager - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Project Managers typically hold QSTI certificates in Groups 1 through 4.

QA Reviews

Air Hygiene's review procedure includes review of each source test report, along with laboratory and fieldwork, by the QA Team. The most important review is the one that takes place before a test program begins. The QA Team works closely with technical division personnel to prepare and review test protocols. Test protocol review includes selection of appropriate test procedures, evaluation of interferences or other restrictions that might preclude use of standard test procedures, and evaluation and/or development of alternate procedures.

Equipment Calibration and Maintenance

The equipment used to conduct the emission measurements is maintained according to the manufacturer's instructions to ensure proper operation. In addition to the maintenance program, calibrations are carried out on each measurement device according to the schedule outlined by the Environmental Protection Agency. Quality control checks are also conducted in the field for each test program. In conformance with ASTM D7036 Section 15.3.15, all metering and monitoring equipment meets or exceeds the uncertainty criteria contained in the method language that pertains to that equipment.

Chain-of-Custody

Air Hygiene maintains full chain-of-custody documentation on all samples and data sheets. In addition to normal documentation of changes between field sample custodians, laboratory personnel, and field test personnel, Air Hygiene documents every individual who handles any test component in the field (e.g., probe wash, impinger loading and recovery, filter loading and recovery, etc.). Samples are stored in a locked area to which only Air Hygiene personnel have access. Field data sheets are secured at Air Hygiene's offices upon return from the field.

Training

Personnel's training is essential to ensure quality testing. Air Hygiene has formal and informal training programs, which include:

1. Attendance at EPA-sponsored training courses
2. Enrollment in EPA correspondence courses
3 A requirement for all technicians to read and understand Air Hygiene's QA manual
4. In-house training and QA meetings on a regular basis
5. Maintenance of training records

Knowledge of Current Test Methods

With the constant updating of standard test methods and the wide variety of emerging test procedures, it is essential that any qualified source tester keep abreast of new developments. Air Hygiene subscribes to services, which provide updates on EPA reference methods, rules, and regulations. Additionally, source test personnel regularly attend and present papers at testing and emission-related seminars and conferences. Air Hygiene personnel maintain membership in the Air and Waste Management Association and the American Industrial Hygiene Association.

Reproduction and Distribution Policy

Reproducing portions of this test report may omit critical or substantial documentation or be taken out of context and due care must be exercised in this regard. Furthermore, this test report and its associated data shall not be reproduced in full or in part without the written consent of the customer.

Data Provided by Client

Data provided by the Client is clearly identified in the report. Air Hygiene accepts data provided by the Client as accurate.

COMBUSTION TESTING QUALITY ASSURANCE ACTIVITIES

In conformance with ASTM D7036 Section 15.3.11 and 13, all testing was performed without any real or apparent errors, with the exception of those that would be listed in Section 2.0 of this report. In addition, all testing was conducted according to the approved testing protocol, test methods, Air Hygiene Quality Manual, or ASTM D7036, with the exception of specifics noted in Section 2.0 of this report. A number of quality assurance activities were undertaken before, during, and after this testing project. This section of the report combined with the documentation in Appendix C describes each of those activities.

Each instrument's response was checked and adjusted in the field prior to the collection of data via multi-point calibration. The instrument's linearity was checked by adjusting its zero and span responses to zero nitrogen and an upscale calibration gas in the range of the expected concentrations. The instrument response was then challenged with other calibration gases of known concentration and accepted as being linear if the response of the other calibration gases agreed within plus or minus two percent of the range of predicted values. NO_2 to NO conversion was checked via direct connect with an EPA Protocol certified concentration of NO_2 in a balance of air or nitrogen. Conversion was verified to be between 90 and 110 percent.

After each test run, the analyzers were checked for zero and span drift. This allowed each test run to be bracketed by calibrations and documents the precision of the data just collected. The criterion for acceptable data is that the instrument drift is no more than three percent of the full-scale response. The quality assurance worksheets in the following pages summarize all multipoint calibration checks and zero to span checks performed during the tests. These worksheets (as prepared from the data records of Appendix A) show that no drifts in excess of three percent occurred in the zero to span checks following each test run.

The sampling systems were leak checked by demonstrating that a vacuum greater than 10 in Hg could be held for at least one minute with a decline of less than one inch of Hg. A leak test was conducted after the sample system was set up and before the system was dismantled. This test was conducted to ensure that ambient air had not diluted the sample. Any leakage detected prior to the tests would be repaired and another leak check conducted before testing commenced. No leaks were found during the pre or post-test leak checks.

The absence of leaks in the sampling system was also verified by a sampling system bias check. The sampling system's integrity was tested by comparing the responses of the analyzers to the calibration gases introduced via two paths. The first path was directly into the analyzer and the second path via the sample system at the sample probe. Any difference in the instrument responses by these two methods was attributed to sampling system bias or leakage. The criterion for acceptance is agreement within five percent of the span of the analyzer.

The control gases used to calibrate the instruments were analyzed and certified by the compressed gas vendors to plus or minus one percent accuracy for all gases. EPA Protocol No. 1 was used, where applicable to assign the concentration values traceable to the National Institute of Standards and Technology (NIST), Standard Reference Materials (SRM's). The gas calibration sheets as prepared by the vendor are contained in Appendix C.

Air Hygiene collected and reported the enclosed test data in accordance with the procedures and quality assurance activities described in this test report. Air Hygiene makes no warranty as to the suitability of the test methods. Air Hygiene also assumes no liability relating to the interpretation and use of the test data.

Accredited Laboratory

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

Broken Arrow, OK

for technical competence in the field of

Environmental Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 *General requirements for the competence of testing and calibration laboratories*. This laboratory also meets the A2LA *R219 – Specific Requirements – TNI Field Sampling and Measurement Organization Accreditation Program*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (*refer to joint ISO-ILAC-IAF Communiqué dated April 2017*).

Presented this 18th day of December 2019

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.01
Valid to August 31, 2021

For the tests to which this accreditation applies, please refer to the laboratory's Envrionmental Scope of Accreditation.

STAC
STACK TESTING ACCREDITATION COUNCIL

A2LA
American Association for Laboratory Accreditation

Accredited Air Emission Testing Body

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

In recognition of the successful completion of the joint A2LA and Stack Testing Accreditation Council (STAC) evaluation process, this laboratory is accredited to perform testing activities in compliance with ASTM D7036:2004 - Standard Practice for Competence of Air Emission Testing Bodies.

Presented this 18th day of December 2019.

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.02
Valid to August 31, 2021

This accreditation program is not included under the A2LA ILAC Mutual Recognition Arrangement.

NOx Converter Efficiency

Date: February 25, 2020

Analyzer: INST-NX-0031

RM 7E, (02-27-14), Sections 7.1.4; 8.2.4.1; 12.7; and 13.5 Introduce NO_2 to the analyzer and record the NOx concentration displayed. ... Calculate the converter efficiency using Equation 7E-7. The specification for converter efficiency must be met. ... Air Hygiene also references ALT-0013 for specific NO_2 concentration (40-60 ppm) and EPA Traceability Protocol requirements (±2%).

Audit Gas:	NO_2 Concentration (C_v), ppmvd	**48.70**
Converter Efficiency Calculations:		
	Analyzer Reading, NO Channel, ppmvd	**1.40**
	Analyzer Reading, NOx Channel, ppmvd	**48.79**
	Analyzer Reading, NO_2 Channel ($C_{Dir(NO2)}$), ppmvd	**47.39**
	Converter Efficiency, %	**97.31**

RM 7E, (02-27-14), 13.5 NO_2 to NO Conversion Efficiency Test (as applicable). The NO_2 to NO conversion efficiency, calculated according to Equation 7E-7, must be greater than or equal to 90 percent.

$$Eff_{NO2} = \left(\frac{C_{Dir}}{C_V}\right) \times 100$$

Eq. 7E-7 = $\frac{47.39 \text{ ppmvd}}{48.70 \text{ ppmvd}}$ x 100 = 97.31%

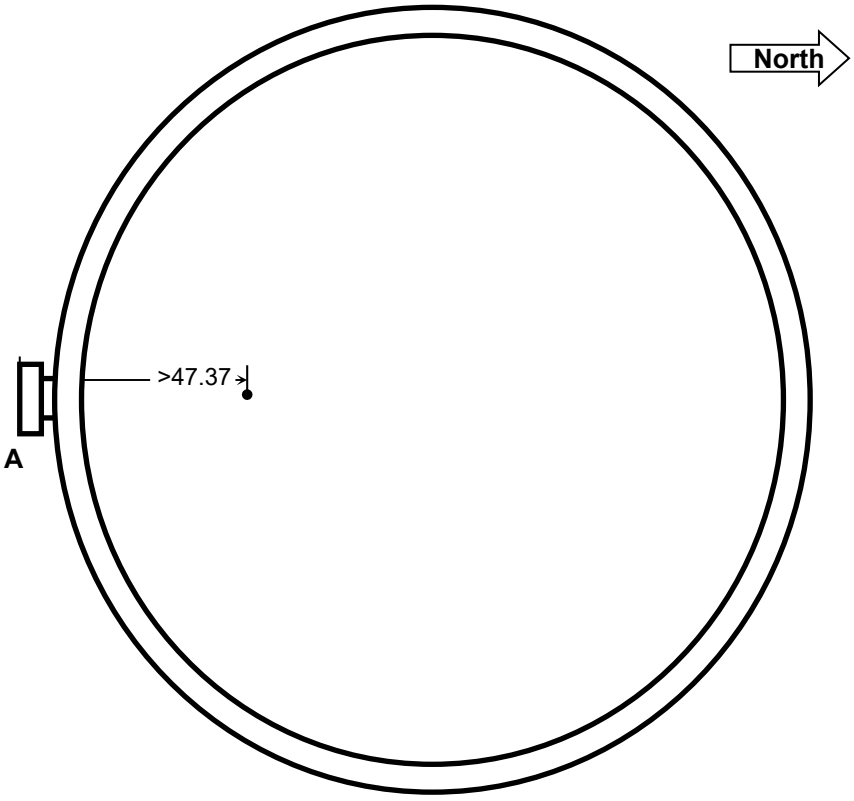
40 CFR 75 Criteria

Stratification Results	
Maximum Percent Difference	2.25 % for O_2
Maximum Pollutant Conc. Diff.	0.32 ppm for NOx
Maximum Diluent Conc. Diff.	0.30 % for O_2
Stratification Conclusions	
Comparison	at least one diluent/pollutant
Stack Diameter	D > 93.6 in.



Under Part 75 criteria at least one measured pollutant or diluent demonstrates a non-stratified stack with subsequent testing from a single point located at least one meter away from the stack wall.

Traverse Point Number	**Percent of Stack Diameter**	**Distance from Inside Wall**	**Distance Including Reference Length**

CERTIFICATE OF ANALYSIS

Grade of Product: EPA Protocol

Part Number:	E02NI99E15A2039	Reference Number:	160-401523613-1
Cylinder Number:	SG910481	Cylinder Volume:	144.3 CF
Laboratory:	124 - Plumsteadville - PA	Cylinder Pressure:	2015 PSIG
PGVP Number:	A12019	Valve Outlet:	350
Gas Code:	CO,BALN	Certification Date:	Jun 20, 2019

Expiration Date: Jun 20, 2027

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty	Assay Dates
CARBON MONOXIDE	7.000 PPM	7.067 PPM	G1	+/- 0.6% NIST Traceable	06/20/2019
NITROGEN	Balance				

CALIBRATION STANDARDS

Type	Lot ID	Cylinder No	Concentration	Uncertainty	Expiration Date
NTRM	061207	KAL003958	9.855 PPM CARBON MONOXIDE/NITROGEN	0.51%	Jun 05, 2024

ANALYTICAL EQUIPMENT

Instrument/Make/Model	Analytical Principle	Last Multipoint Calibration
MKS FTIR - CO - 000928781	FTIR	Jun 07, 2019

Gas Code:	CO,NO,NOX,BALN	Certification Date:	Jul 22, 2019

Expiration Date: Jul 22, 2027

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty	Assay Dates
NOX	180.0 PPM	176.8 PPM	G1	+/- 0.5% NIST Traceable	07/15/2019, 07/22/2019
NITRIC OXIDE	180.0 PPM	176.8 PPM	G1	+/- 0.5% NIST Traceable	07/15/2019, 07/22/2019
CARBON MONOXIDE	1700 PPM	1709 PPM	G1	+/- 0.5% NIST Traceable	07/15/2019
NITROGEN	Balance				

CALIBRATION STANDARDS

Type	Lot ID	Cylinder No	Concentration	Uncertainty	Expiration Date

1. INTRODUCTION

Cricket Valley Energy Center is a facility located in Dover Plains, New York. The facility consists of three natural gas-fired combined cycle electric generating units identified as U-00001 (U001), U-00002 (U002), and U-00003 (U003). In addition to the air emitting equipment, the Facility will include three steam turbine generators (STGs), an air cooled condenser (ACC) and associated auxiliary equipment and systems. This certification report pertains to the U-00003 (U003), which consists of a General Electric (GE) Model 7FA.05 combustion turbine generators (CTGs) operating in combined-cycle mode with supplemental firing of the heat recovery steam generators (HRSGs), which has a nominal generating capacity of 333 MW. The maximum potential when incorporated with the steam turbine generator megawatts as per 40 CFR 75 is 383 MW. Natural gas will be the sole fuel fired in the CTGs and duct burners. Each combined cycle generating unit consisting of the CTG, HRSG and STG will be exhausted through its own stack. In addition, to oxidation catalyst being used to control CO emission, both dry-low NO_X burners (DLNB) and Selective Catalytic Reduction (SCR) are used for NO_X control on each unit. Exhaust gases from the turbines are discharged into the atmosphere through a stack approximately 282.5 feet above grade. A dedicated CEMS will monitor NO_X, CO, NH_3(NO_X) and O_2 emissions and gas fuel flow from each of the three units. This report focuses on the U-00003 CEMS.

Custom Instrumentation Services Corporation of Englewood, Colorado built the Continuous Emission Monitoring System. Data from the CEMS is recorded and stored on a Data Acquisition and Handling System (DAHS).

The CEMS on the U-00003 unit was designed to meet the monitoring and reporting requirements of New York State Department of Environmental Conservation (NYSDEC) Permit No. 3-1326-00275/00009 and the regulatory requirements of 40 CFR 60 (NO_X, NH_3, CO and O_2 analyzers) and 40 CFR 75 (NO_x and O_2 analyzers). This report presents the results of the initial certification tests performed on the NO_x, NO_X/NH_3, CO and O_2 analyzers. The testing was performed in accordance with the requirements of 40 CFR 60, Appendix B, Performance Specification 2, 3, 4a and 40 CFR 75, Appendix A.

In addition, this report provides documentation of the DAHS missing data substitution and formula verification as well as fuel flow meter transmitter accuracy tests and orifice plate primary element visual inspections performed, as required by 40 CFR 75 for the initial certification.

Field certification testing on Unit U-00003 occurred between March 27, 2020 and April 4, 2020. The tests conducted under 40 CFR 75 on the NO_x and O_2 CEMS included Relative Accuracy Test Audit (RATA), Bias Check, 7-Day Calibration Error Test, Linearity Check and Cycle Time Test. The tests conducted under 40 CFR 60 on NO_X, NH_3/NO_X, CO and O_2 CEMS included RATA, 7-Day Calibration Drift Test and CO Response Time Test. A summary of the tests performed on each analyzer is provided in Table 1.

Printouts of the tests results and revised monitoring plans for the 40 CFR 75 NO_x and O_2 CEMS from EPA's Emissions Collection and Monitoring Plan System (ECMPS) Software are provided in Appendix 1.

Air Hygiene, International(AHI) of Broken Arrow, Oklahoma conducted the RATAs on the NO_x, NH_3/NO_X, CO and O_2 CEMS. On March 4, 2020 ten (10) 21-minute runs were completed on the unit. The results of the RATAs are summarized in Table 1. As shown, the Relative Accuracy calculations on the analyzers were within the EPA and NYSDEC specifications for all parameters. A detailed description of the RATAs conducted are provided in Section 2.1 and the AHI test report in Appendix 6.

A bias check evaluation was made on the NO_x lb/mmBtu relative accuracy results as required in 40 CFR 75. The bias adjustment factor for the NO_x monitoring systems (NO_x lb/mmBtu) is provided in Table 1. The bias test results are discussed in Section 2.2. Supporting data is provided in the relative accuracy tables in the AHI RA report in Appendix 6.

The 40 CFR 60 7-day Calibration Drift and 40 CFR 75 7-Day Calibration Error tests for U-00003 CEMS occurred during seven consecutive unit operating days from March 27, 2020 through April 2, 2020. The results of these tests are summarized in Table 1. As shown, the analyzers operated well within the applicable specifications. An explanation of the calibration drift and calibration error tests is provided in Section 2.3 and supporting documentation is provided in Appendix 2 of this report.

Although not required for the initial certification, Online/Offline Calibration Error Demonstration tests were performed on the 40 CFR 75 NO_x and O_2 analyzers on March 25, 2020 to allow the use of offline calibrations to validate the Part 75 data during subsequent normal operation. Information on the Online/Offline calibration error demonstration tests is also provided in Section 2.3 and Appendix 2 of this report.

The U-00003 Linearity Checks were performed on the 40 CFR 75 NO_x and O_2 analyzers on April 4, 2020. The NO_x and O_2 Cycle Time Tests and the CO Response Time tests were performed April 4, 2020. The results of these tests are summarized in Table 1. As shown, the analyzers operated well within EPA specifications for all parameters. An explanation of the linearity check is provided in Section 2.4. Explanations of the cycle time and response time tests are provided in Section 2.5. Audit reports for the linearity checks and supporting documents for the cycle time/response time tests are provided in Appendices 3 and 4, respectively.

The DAHS missing data substitution verification and formula verification tests took place March 8, 2020. The DAHS passed all the tests required by EPA. The DAHS tests are described in Section 3 and supporting documents are provided in Appendix 5. Please note that although not required by 40 CFR 60, DAHS formula verifications are also provided for the CO analyzers.

In summary, based on the results of the initial certification tests performed on the CEMS installed on the U-00003 stacks at the Cricket Valley Energy Center, the CEMSs met the

requirements in 40 CFR 60, Appendix B Performance Specification 2, 3, 4a and 40 CFR 75, Appendix A and are therefore certified to provide accurate and reliable data under these regulations and under the NYSDEC air permit. These CEMS will continue to be calibrated, maintained, and operated following the requirements of 40 CFR 60, Appendix F and 40 CFR 75, Appendix B.

TABLE 1.
SUMMARY OF CEMS CERTIFICATION TESTS RESULTS

U-00003 (U003)	RESULTS	STANDARD	PASS / FAIL
	RELATIVE ACCURACY		
NO_x ppm @ 15% O_2	14.33% RA RM	20% RA RM or 10% ARA[1]	PASS
NO_x lb/hr	11.59% RA RM	20% RA RM or 10% ARA	PASS
NO_x lb/mmBtu	0.001 lb/mmBtu MD	7.5% RA RM or 0.015 lb/mmBtu MD[2]	PASS
CO ppm @ 15% O_2	0.2 ppm MD	10% RA RM or 5% ARA or ±5 ppm MD[3]	PASS
CO lb/hr	0.2 ppm MD	10% RA RM or 5% ARA or ±5 ppm MD	PASS
NH_3 ppm @ 15% O_2	4.34% RA RM	20% RA RM or 10% ARA	PASS
NH_3 lb/hr	3.84% RA ARA[4]	20% RA RM or 10% ARA	PASS
O_2 %	0.08% RA RM	20% RA RM or 1% O_2 MD	PASS
	BIAS TEST		
Adjustment Factor	1.000	NA	PASS
	24-HOUR ZERO DRIFT[5]		
NO_x low	0.2% of span	2.5 % of span	PASS
NO_x high	0.0% of span	2.5 % of span	PASS
CO low	3.90% of span	5 % of span	PASS
CO high	0.00% of span	5 % of span	PASS
$NH_3/(NO_x)$	0.63% of span	2.5 % of span	PASS
O_2 %	0.04% O_2	0.5% O_2	PASS
	24-HOUR SPAN DRIFT[5]		
NO_x low	0.4% of span	2.5 % of span	PASS
NO_x high	0.4% of span	2.5 % of span	PASS
CO low	4.30% of span	5 % of span	PASS
CO high	0.34% of span	5 % of span	PASS
$NH_3/(NO_x)$	0.31% of span	2.5 % of span	PASS
O_2 %	0.03% O_2	0.5% O_2	PASS
	LINEARITY[5]		
NO_x high ppm	2.2% LE	5% LE	PASS
O_2 %	0.7% LE	5% LE	PASS
	CYCLE TIME/CO RESPONSE TIME TEST(S) [5]		
NO_x lb/mmBtu	2 Minutes	15 Minutes	PASS
CO low	173 Avg. Seconds	240 Avg. Seconds	PASS
	DAHS VERIFICATION		
DAHS Computer	Verified (03/08/2020)	Verify	PASS
ANALYZER SERIAL NUMBERS			
NO_x		1014	
O_2		151	
CO		520	
NH_3/NO_X		1049	

[1] ARA = alternative relative accuracy determined from the permit applicable standard.

[2] RATA RESULTS REQUIRED FOR ANNUAL RATA FREQUENCY FOR 40 CFR 75

[3] MD =|d| +|2.5% CC

[4] NYSDEC permit ID 3-1326-00275/00009 does not have a current NH3 lb/hr limit, so a conservative value (16.66 lb/hr) was back-calculated from the existing 5 ppm corrected limit. Calculation is provided in Air Hygiene RATA report in Appendix 6.

[5] DRIFT, LINEARITY CTT/RTT RESULTS ARE THE HIGHEST ENCOUNTERED DURING ALL TESTS

2. CEMS CERTIFICATION TESTS

Field tests were performed for the initial CEMS certification in accordance with the requirements of 40 CFR 60, Appendix B and 40 CFR Part 75, Appendix A. The results for all tests were determined from the data collected by the DAHS. The computer printouts for each field test are included in the Appendices.

2.1 RELATIVE ACCURACY TEST AUDIT

Relative accuracy testing was performed on April 4, 2020 by AHI, a source testing company that meets the EPA Air Emissions Testing Body (AETB) requirements. Each test run was a minimum of 21 minutes in duration and consisted of sampling for NO_x, NH_3 (NO_X), CO and O_2. The times during which the tests were performed and additional information on stratification test, NO_x converter efficiency check and reference method calibrations are provided in the AHI report in Appendix 6.

The reference methods used by AHI are outlined below:

CONSTITUENT	METHOD
O_2	EPA METHOD 3A
NO_x	EPA METHOD 7E
$NH_3(NO_x)$	EPA METHOD 7E
CO	EPA METHOD 10

As shown in the Relative Accuracy tables in the AHI report in Appendix 6, relative accuracy is reported as an error and is the sum of the absolute mean value of the differences between the reference method tests and the instrument readings, plus the 95 percent confidence interval of the differences, expressed as a percentage of the mean reference method value or the emission standard. As an alternative, 40 CFR 75 allows low NO_x emitters (less than 0.20 lb/mmBtu) to express relative accuracy as the difference between the average reference method value and the average CEMS value. Performance Specification 4a in 40 CFR 60, Appendix B also allows for CO relative accuracy results to be expressed as a mean difference between the reference method average value and CEMS average value.

The analyzer response was determined from the average of readings taken every minute for the duration of the time the relative accuracy tests were performed. The 1-Minute Data Reports from the CEMS are included in the AHI report.

The NO_x, $NH_3(NO_X)$, CO and O_2. analyzers passed the relative accuracy requirements (as stated in 40 CRF 60, Appendix B 2, 3, 4a). In addition, the NO_x diluent systems (NO_x and O_2 analyzers combined) passed the relative accuracy requirements as stated in 40 CRF 75, Appendix A and based on the RATA results, these systems qualify for annual RATA frequency under 40 CFR 75.

2.2 BIAS CHECK

The relative accuracy result for the NO_x diluent systems reported in lb/mmBtu was checked for low bias by determining if the mean difference between the test team's values and the CEMS values was greater than the absolute value of the confidence coefficient. U-00003 NO_x diluent systems did not exhibit bias. Therefore, the bias adjustment factor (BAF) for the unit was 1.000. In general, the BAF is determined after each RATA test.

2.3 7 DAY CALIBRATION ERROR/DRIFT TEST & ONLINE/OFFLINE DEMONSTRATION TESTS

In general, the U-00003 7-day calibration error/drift tests required by 40 CFR 60 and 40 CFR 75 on the NO_x, NH_3 (NO_X), CO and O_2. analyzers occurred between March 27, 2020 and April 2, 2020. All tests occurred on seven consecutive unit-operating days when the unit was combusting fuel. The NO_x and O_2 calibration gases used for the zero and span calibration error tests meet the requirements of the EPA 40 CFR 75, Appendix A, Protocol Gas Verification Program (PGVP). The certificates of analysis for the cylinders used to meet the requirements of both 40 CFR 60 and 40 CFR 75 drift/calibration error requirements are included in Appendix 8 of this report.

Although not required for the initial certification, this report includes the results of the Online/Offline Calibration Error Demonstration tests that were performed on March 25, 2020. 40 CFR 75 Appendix B §2.1.1.2 allows the use of offline calibrations for the purpose of validating online data if both offline and online calibrations are performed within 26-clock hours and meets the performance specification criteria of 40 CFR 75 Append A, §3.1.

The data from calibrations occurring over seven days and the offline determination occurring within 26-clock hours are summarized in Appendix 2 of this report. As shown, the calibration error/drift for all analyzers were well within EPA requirements as stated in 40 CFR 60, Appendix B and 40 CFR 75, Appendix A. The calibration summary reports are provided in Appendix 2.

2.4 LINEARITY CHECKS

The U-00003 NO_x and O_2 linearity checks were performed on April 4, 2020. To perform the linearity check, the high ranges of the NO_x analyzers and the O_2 analyzers were challenged three times with each of three levels of calibration gas (low, mid and high). The mean difference between the analyzer response and the calibration gas value, as a percentage of the calibration gas value, must be within 5%. Results are also acceptable if the difference between the mean response and the calibration gas value is within 0.5% O_2 or 5 ppm NO_x. The results were well within the requirements of 40 CFR 75, Appendix A.

A summary of the linearity check results are provided in Appendix 3 and the certificates of analysis for the calibration gases used during the checks are provided in Appendix 8. The calibration gases used for the linearity checks met the US EPA PGVP requirements of 40 CFR 75, Appendix A.

2.5 CYCLE TIME & RESPONSE TIME TESTS

The U-00003 cycle time tests were performed on April 4, 2020. To perform the test, the NO_x and O_2 analyzers were challenged with a zero gas and a high level (80 to 100% of span) calibration gas. Both the upscale and down scale response times were determined. As stated in 40 CFR 75, Appendix A, the response time to reach 95% of the gas value must be less than 15 minutes.

40 CFR 75, Appendix A, Section 6.4 specifies that on and after January 1, 2009, the cycle time for each component analyzer of a NO_x diluent system must be recorded separately. It also specifies that for monitors with dual ranges, the test results for each range must be reported separately. Cycle time test results are acceptable for monitoring system certification if none of the cycle times exceed 15 minutes. The down scale and upscale cycle times for the NO_x low range, NO_x high range and O_2 analyzers met this specification.

The U-00003 CO response time tests were performed on April 4, 2020 to meet the requirements of 40 CFR 60. To perform this test, the low range of the CO analyzer was challenged with a zero gas and a high level (50 to 100% of range) calibration gas. Both the upscale and down scale response time averages were determined. As stated in 40 CFR 60, Appendix B, Performance Specification 4A the response time to reach 95% of the gas value must be less than 240 seconds. For the upscale and downscale readings the longer of the two response times is the response time for the analyzer. The response time for the low range of the CO analyzers met this requirement. The gas cylinders used to perform the CO response time tests are provided in Appendix 8.

Audit reports that show the analyzers response in ten second increments are located in Appendix 4. The gas cylinders used to perform the NO_X/O_2 cycle time tests meet the US EPA PGVP requirements of 40 CFR 75, Appendix A and are provided in Appendix 8.

3. DAHS VERIFICATION

A letter from the 40 CFR 75 software vendor (CiSCO CEMS) stating that each of the missing data routines and calculations performed by the DAHS was verified is included in Appendix 5. A formula verification is also included. All variables included in the calculations (bias adjustment factor, fuel inputs) were used. The formula verification spreadsheet and associated printouts are also included in Appendix 5.

4. FUEL FLOWMETER CERTIFICATION TESTS DOCUMENTATION

Documents demonstrating that the fuel flowmeters installed in each combustion turbine and duct burner meet the 2% upper range accuracy specified in 40 CFR 75 Appendix D are provided in Appendix 7. This includes Certificate of Compliance document, which references ASME MFC 9M:2006 calibration which demonstrates compliance with 40 CFR 75 Appendix D Section 2.1.5.1 certification criteria.

5. DISCUSSION OF RESULTS

The CEMS and DAHS on the U-00003 combustion turbine generators at the Cricket Valley Energy Center successfully met all the requirements of the EPA, as outlined in 40 CFR 60 and 40 CFR 75. An electronic QA certification file in the format specified by EPA Clean Air Markets Division for 40 CFR 75 has been prepared for each unit and will be submitted via ECMPS within 45 days of test completion.

APPENDIX 3

LINEARITY CHECK DOCUMENTATION

Turbine 3 NOx/H Linearity

Cricket Valley Energy Center

Test Information

Test Date: **4/3/2020**
Test Reason:
Grace Period: No
Aborted: No
Unit online during QA test

Analyzer and Monitor Information

Range: High
Instrument Span: 200 ppm
Component ID: 310
Manufacturer: TELEDYNE
Model: T200M
Serial Number: 1014

Run Number	Time	Reference Gas	CEMS Response		Cylinder Information
Low Gas					
1	7:05 PM	49.4	48.2		Allowable Reference Values: 40-60 ppm (20-30% of span)
2	7:17 PM	49.4	48.4		
3	7:30 PM	49.4	48.4		Cylinder ID: CC712750
	Mean (ppm)	49.4	48.3		Expiration Date: 6/27/2022
	Difference of means (|R-A|) (ppm)	1.1	*Limit 5*	*Passed*	EPA Vendor ID: G12019
	Linearity Error (%)	2.2	*Limit 5.0*	*Passed*	Cylinder contains: NO,NOX,CO,BALN
Mid Gas					
1	7:09 PM	109.4	110.7		Allowable Reference Values: 100-120 ppm (50-60% of span)
2	7:22 PM	109.4	110.6		
3	7:34 PM	109.4	110.4		Cylinder ID: CC719253
	Mean (ppm)	109.4	110.6		Expiration Date: 9/24/2026
	Difference of means (|R-A|) (ppm)	1.2	*Limit 5*	*Passed*	EPA Vendor ID: G12018
	Linearity Error (%)	1.1	*Limit 5.0*	*Passed*	Cylinder contains: NO,NOX,CO,BALN
High Gas					
1	7:13 PM	180.2	180.6		Allowable Reference Values: 160-200 ppm (80-100% of span)
2	7:26 PM	180.2	180.5		
3	7:38 PM	180.2	180.6		Cylinder ID: CC435700
	Mean (ppm)	180.2	180.6		Expiration Date: 2/11/2028
	Difference of means (|R-A|) (ppm)	0.4	*Limit 5*	*Passed*	EPA Vendor ID: B22019
	Linearity Error (%)	0.2	*Limit 5.0*	*Passed*	Cylinder contains: CO,NO,NOX,BALN

Linearity Error (LE) Determination

*LE (%) = (|R-A| / R) * 100*

R = Reference gas value

A = Mean of actual CEMS responses

Turbine 3 O2 Linearity

Cricket Valley Energy Center

Test Information

Test Date: **4/3/2020**
Test Reason:
Grace Period: No
Aborted: No
Unit online during QA test

Analyzer and Monitor Information

Range: Single Scale
Instrument Span: 25 %O2
Component ID: 320
Manufacturer: TELEDYNE
Model: T802
Serial Number: 151

Run Number	Time	Reference Gas	CEMS Response		Cylinder Information
Low Gas					
1	6:18 PM	6.03	6.06		
2	6:33 PM	6.03	6.06		Allowable Reference Values:
3	6:48 PM	6.03	6.07		5-7.5 %O2 (20-30% of span)
	Mean (%O2)	6.03	6.06		Cylinder ID: EB0049417
	Difference of means (|R-A|) (%O2)	0.0	*Limit 0.5*	*Passed*	Expiration Date: 8/13/2021
					EPA Vendor ID: L12013
	Linearity Error (%)	0.6	*Limit 5.0*	*Passed*	Cylinder contains: CO2,O2,BALN
Mid Gas					
1	6:23 PM	13.46	13.55		
2	6:38 PM	13.46	13.55		Allowable Reference Values:
3	6:53 PM	13.46	13.56		12.5-15 %O2 (50-60% of span)
	Mean (%O2)	13.46	13.55		Cylinder ID: EB0053431
	Difference of means (|R-A|) (%O2)	0.1	*Limit 0.5*	*Passed*	Expiration Date: 6/13/2023
					EPA Vendor ID: G12015
	Linearity Error (%)	0.7	*Limit 5.0*	*Passed*	Cylinder contains: O2,BALN
High Gas					
1	6:28 PM	22.20	22.22		
2	6:43 PM	22.20	22.23		Allowable Reference Values:
3	6:58 PM	22.20	22.24		20-25 %O2 (80-100% of span)
	Mean (%O2)	22.20	22.23		Cylinder ID: ALMO47793
	Difference of means (|R-A|) (%O2)	0.0	*Limit 0.5*	*Passed*	Expiration Date: 3/4/2027
					EPA Vendor ID: A12019
	Linearity Error (%)	0.1	*Limit 5.0*	*Passed*	Cylinder contains: CO2,O2,BALN

Linearity Error (LE) Determination

*LE (%) = (|R-A| / R) * 100*

R = Reference gas value

A = Mean of actual CEMS responses

APPENDIX 5

DAHS VERIFICATION DOCUMENTATION

CUSTOM INSTRUMENTATION SERVICES CORPORATION

Data Acquisition and Handling System (DAHS) Verification Documentation

CeDAR and Breez75X ECMPS Reporting Software

Developed by:
Custom Instrumentation Services Corporation

EPA Regulations

- 40CFR75 Acid Rain
- 40CFR97 CSAPR NOx and SO_2

This letter serves as notice that the required 40 CFR 75 DAHS (missing data and formula) verification have been conducted and passed.

The attached formula verification document which includes CeDAR printouts demonstrates that the DAHS accurately calculates regulated parameters using raw data. In addition, verification tests have been conducted and passed for all missing data substitution routines for ECMPS reporting according to all applicable regulations and specifications in 40 CFR 75 Appendix D and Subpart D. The attached checklist, as adapted from Section 15 of the Acid Rain Program Policy Manual (revised) for 40CFR75, provides the regulatory description of the data substitution criteria.
These verification tests were conducted using numerous data sets at varying loads and operating conditions as well as various missing data periods as described in each set of tests. The tests were conducted using data sets with known outcomes and criteria and were verified against those outcomes. All missing data substitution procedures have been verified to be accurate and correct. Detailed data sets and documentation and test documentation are provided below

SO_2 Missing Data Verification Checklist [1]

Initial SO_2 Data Substitution: 75.31

Description	Regulation
Prior to 720 QA hours, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.31(b)(1)
Prior to 720 QA hours, non-QA data is substituted with the MPC if previous QA data does not exist.	75.31(b)(2)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard SO_2 Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period.	75.33(b)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period.	75.33(b)(2)(ii)(B)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period.	75.33(b)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(b)(4)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous SO_2 Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

O_2 Missing Data Verification Checklist

Initial O_2 Data Substitution: 75.31

Description	Regulation
Prior to 720 QA hours, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(b) 75.31(b)(1)
Prior to 720 QA hours, non-QA data is substituted with the MPC if previous QA data does not exist.	75.36(b) 75.31(b)(2)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard O2 Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 10th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 10th percentile of the lookback period.	75.36(d) 75.33(b)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 5th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.36(d) 75.33(b)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 5th percentile of the lookback period.	75.36(d) 75.33(b)(2)(ii)(B)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the minimum value in the lookback period.	75.36(d) 75.33(b)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.36(d) 75.33(b)(4)
Substitution routines have a maximum lookback period of 26280 hours.	75.36(d) 75.33(a)

Miscellaneous SO_2 Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.31(c)(1)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range.	75.31(c)(2)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges.	75.31(c)(3)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range.	75.33(c)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.33(c)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(c)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range.	75.33(c)(2)(ii)(B)

For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range.	75.33(c)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(c)(4)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used.	75.33(c)(5)
If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous NOx Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

Appendix D Fuel Flow Rate Missing Data Verification Checklist

Single Fuel Hours, Load Based: Appendix D

Description	Regulation
Non-QA data is substituted with the average of the lookback period at the corresponding load range when only the same fuel was combusted.	App. D 2.4.2.2.1
Non-QA data is substituted with the average of the lookback period at the next higher available load range when only the same fuel was combusted if no data in the corresponding load range exists.	App. D 2.4.2.2.1
Non-QA data is substituted with the a maximum potential flow rate if no data in the lookback period at the corresponding or higher load range when only the same fuel was combusted exists.	App. D 2.4.2.2.1
Substitution routines have a maximum lookback period of 26280 hours.	App. D 2.4.3

Co-Fired Fuel Hours, Load Based: Appendix D

Description	Regulation
Non-QA data is substituted with the maximum in the lookback period at the corresponding load range when the same fuel is co-fired with another fuel.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Non-QA data is substituted with the maximum in the lookback period at the next higher available load range when the same fuel is co-fired with another fuel.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Non-QA data is substituted with a maximum potential flow rate if no data in the lookback period at the corresponding or higher load range when the same fuel is co-fired with another fuel exists.	App. D 2.4.2.3.1 App. D 2.4.2.3.3
Substitution routines have a maximum lookback period of 26280 hours.	App. D 2.4.3

Note: If Maximum Heat Rate is exceeded, manual adjustment of Fuel Flows is allowed so that reported Heat Rate equals the maximum. (App. D 2.4.2.3.4)

Fuel Specific NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range.	75.31(c)(1)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range.	75.31(c)(2)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges.	75.31(c)(3)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Fuel Specific NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(i) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(ii)(A) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(1)(ii)(B) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(i) 75.33(c)(8)(i) 75.33(c)(8)(ii)

For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(ii)(A) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(2)(ii)(B) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(3) 75.33(c)(8)(i) 75.33(c)(8)(ii)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a fuel specific MPC.	75.33(c)(4) 75.33(c)(8)(iii)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used. Historical data is separated into fuel specific pools with co-fired hours either treated as a separate fuel or the fuel with the highest emission rate.	75.33(c)(5) 75.33(c)(8)(i) 75.33(c)(8)(ii)
If no data in the corresponding or higher load ranges exists in the lookback period, the fuel specific MPC is used.	75.33(c)(6) 75.33(c)(8)(iii)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a) 75.33(c)(8)

Miscellaneous Fuel Specific NO_X Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

CUSTOM INSTRUMENTATION SERVICES CORPORATION

Season Specific NO_X Missing Data Verification Checklist

Initial NO_X Data Substitution: 75.31

Description	Regulation
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(1) 75.74(c)(7)
Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(2) 75.74(c)(7)
Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges. Historical data is separated into season specific pools.	75.31(c)(3) 75.74(c)(7)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Season Specific NO_X Data Substitution: 75.33

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(i) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(A) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(B) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(2)(i) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(2)(ii)(A) 75.34(a)(2) 75.74(c)(7)

For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(2)(ii)(B) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period at the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(3) 75.34(a)(2) 75.74(c)(7)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with an MPC.	75.33(c)(4) 75.74(c)(7)
If no data in the lookback period exists for the corresponding load range, the maximum value at the next higher available load range is used. Historical data is separated into season specific pools.	75.33(c)(5) 75.34(a)(2) 75.74(c)(7)
If no data in the corresponding or higher load ranges exists in the lookback period, the MPC is used.	75.33(c)(6) 75.34(a)(2) 75.74(c)(7)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a) 75.34(a)(2) 75.74(c)(7)

Miscellaneous Season Specific NO_X Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)
For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)

CO_2 Missing Data Verification Checklist 2

Initial CO_2 Data Substitution: 75.35(b) [75.31]

Description	Regulation
Prior to 720 QA hours, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.31(b)(1)
Prior to 720 QA hours, non-QA data is substituted with the MPC if previous QA data does not exist.	75.31(b)(2)
Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)

Standard CO_2 Data Substitution: 75.35(d) [75.33]

Description	Regulation
For non-QA data blocks less than or equal to 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(1)(i)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the 90th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(1)(ii)(A)
For non-QA data blocks greater than 24 hours with an availability of 95.0% or greater, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 90th percentile of the lookback period.	75.33(b)(1)(ii)(B)
For non-QA data blocks less than or equal to 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage.	75.33(b)(2)(i)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the 95th percentile of the lookback period if the substitution value is greater than the average of the data from the hour before and after the outage.	75.33(b)(2)(ii)(A)
For non-QA data blocks greater than 8 hours with an availability greater than or equal to 90.0% and less than 95.0%, non-QA data is substituted with the average of the data from the hour before and after the outage if the substitution value is greater than the 95th percentile of the lookback period.	75.33(b)(2)(ii)(B)
For non-QA data blocks with an availability greater than or equal to 80.0% and less than 90.0%, non-QA data is substituted with the maximum value in the lookback period.	75.33(b)(3)
For non-QA data blocks with an availability below 80.0%, non-QA data is substituted with a MPC.	75.33(b)(4)
Substitution routines have a maximum lookback period of 26280 hours.	75.33(a)

Miscellaneous CO_2 Data Substitution

Description	Regulation
For Non-QA data blocks that cross quarter boundaries, the two missing data block portions will be handled individually with respect to the quarter they end or start.	Reporting Instructions II(C)(12)

Miscellaneous Fuel Specific NOx Data Substitution

P/F	Description	Regulation	Test
	For Non-QA data blocks that cross quarter boundaries, the missing data block ends or starts with the quarter.	Reporting Instructions II(C)(12)	DS3 6/30/03 7/1/03
	For non-combusting periods within an outage, the non-combusting hours are not counted in the size of the non-QA block.	Reporting Instructions II(C)(12)	DS3 8/6/03

Season Specific NOx Missing Data Verification Checklist

Initial NOx Data Substitution: 75.31

P/F	Description	Regulation	Test
	Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(1) 75.74(c)(7)	DS1 1/1/99
	Prior to 2160 QA hours, non-QA data is substituted with the average of the lookback period in the next higher available load range if prior data does not exist in the corresponding load range. Historical data is separated into season specific pools.	75.31(c)(2) 75.74(c)(7)	DS2 4/3/99
	Prior to 2160 QA hours, non-QA data is substituted with the MPC if previous data does not exist in the corresponding or higher load ranges. Historical data is separated into season specific pools.	75.31(c)(3) 75.74(c)(7)	DS1 1/31/99
	Initial data substitution routines are to be used no more than 26280 clock hours after certification.	75.31(a)	DS3 12/30/01

Season Specific NOx Data Substitution: 75.33

P/F	Description	Regulation	Test
	For non-QA data blocks less than or equal to 24 hours with an availability of 95% or greater, non-QA data is substituted with the average of the lookback period in the corresponding load range. Historical data is separated into season specific pools.	75.33(c)(1)(i) 75.34(a)(2) 75.74(c)(7)	DS1 4/20/99
	For non-QA data blocks greater than 24 hours with an availability of 95% or greater, non-QA data is substituted with the 90th percentile of the lookback period in the corresponding load range if the substitution value is greater than the average of the data from the hour before and after the outage. Historical data is separated into season specific pools.	75.33(c)(1)(ii)(A) 75.34(a)(2) 75.74(c)(7)	DS1 5/31/99

Relative Accuracy Test Audit
General Electric, 7F.05, Unit #U-00003 CEMS
Cricket Valley Energy Center, LLC
Cricket Valley Energy Center
Dover Plains, New York
April 4, 2020

1.0 INTRODUCTION

Air Hygiene International, Inc. (Air Hygiene) has completed the Relative Accuracy Test Audit (RATA) for nitrogen oxides (NOx), carbon monoxide (CO), ammonia (NH_3), and oxygen (O_2) from the exhaust of the General Electric, 7F.05, Unit #U-00003 for Cricket Valley Energy Center, LLC at the Cricket Valley Energy Center in Dover Plains, New York. This report details the background, results, process description, and the sampling/analysis methodology of the stack sampling survey conducted on April 4, 2020.

The accumulated data from the RATA provides the figures for evaluating the acceptability of the operation of the on-site continuous emission monitoring system (CEMS) for the monitoring of NOx, CO, NH_3, and O_2 from the General Electric, 7F.05, Unit #U-00003 for Cricket Valley Energy Center, LLC at the Cricket Valley Energy Center in Dover Plains, New York.

1.1 TEST PURPOSE AND OBJECTIVES

The purpose of the test was to perform the initial certification RATA on the CEMS that serves the General Electric, 7F.05, Unit #U-00003 for Cricket Valley Energy Center, LLC at the Cricket Valley Energy Center in Dover Plains, New York. Reference method (RM) testing followed the Code of Federal Regulations (CFR), Title 40 (40 CFR), Part 60 (40 CFR 60), Appendix A, Methods 1, 3A, 7E, 10, 19; and 40 CFR 63, Appendix A, Method 320. RM values are compared with the on-site CEMS to document performance as required in the 40 CFR 60, Appendix B, Performance Specifications (PS) and 40 CFR 75 Appendix A and B. All relative accuracies were established on-site and were governed by the following sets of rules:

In accordance with 40 CFR 60, Appendix B, PS 2, Section 13.2, the NOx and NH_3 RATA results are acceptable if the relative accuracy (RA) does not exceed 20.0 percent when average emissions during the test are greater than 50 percent of the emission standard or alternative relative accuracy (ARA) does not exceed 10.0 percent when the average emissions during the test are less than 50 percent of the emission standard. Part 60 further requires that the unit be operating at greater than 50 percent of normal load.

In accordance with 40 CFR 75, Appendix A, Section 3.3.2(a) and (b), the NOx RATA results are acceptable if the relative accuracy (RA) does not exceed 10.0 percent or if during the RATA the average NOx emission rate is less than or equal to 0.200 lb/MMBtu and the average difference between the CEMS and reference method (RM) values does not exceed 0.020 lb/MMBtu. Passing this set of criteria requires the CEMS to be retested after no more than two operating quarters. Alternatively, in accordance with 40 CFR 75, Appendix B, Section 2.3.1.2(a) and (f), and Appendix B, Figure 2, the NOx RATA results are acceptable if the RA does not exceed 7.5 percent or if during the RATA the average NOx emission rate is less than or equal to 0.200 lb/MMBtu and the average difference between the CEMS and RM values does not exceed 0.015 lb/MMBtu. Passing this set of criteria allows the CEMS to be retested after four operating quarters or at least within eight calendar quarters.

In accordance with 40 CFR 60, Appendix B, PS 3, Section 13.2, the O_2 RATA results are acceptable if the relative accuracy (RA) does not exceed 20.0 percent or if the average difference between the CEMS and reference method (RM) values does not exceed plus or minus 1.0 percent of the measured value.

In accordance with 40 CFR 60, Appendix B, PS 4 and 4A, Sections 13.2 of each, the CO relative accuracy (RA) test results are acceptable if the RA does not exceed 10.0 percent, if the average difference between the CEMS and reference method (RM) values plus the 2.5 percent confidence coefficient (2.5%CC) does not exceed 5.0 parts per million (ppm), or if the alternative relative accuracy (ARA) does not exceed 5.0 percent. Part 60 further requires that the unit be operating at greater than 50 percent of normal load.

1.2 SUMMARY OF TEST PROGRAM

The following list details pertinent information related to this specific project:

1.2.1 Participating Organizations
- New York State Department of Environmental Conservation (NYSDEC)
- Cricket Valley Energy Center, LLC
- Custom Instrumentation Services Corporation (CiSCO)
- Bechtel
- Air Hygiene

1.2.2 Industry
- Electric Utility / Electric Services

1.2.3 Air Permit and Federal Requirements
- Permit Number: 3-1326-00275/00009
- DEC ID: 3132600275
- 40 CFR 60, Appendix B, Performance Specifications (PS)
- 40 CFR 75, Appendix A and B

1.2.4 Plant Location
- Cricket Valley Energy Center in Dover Plains, New York
  - GPS Coordinates [Latitude 41.67616, Longitude -73.576914]
  - 2241 Route NY 22, Dover Plains, New York 12522
  - Federal Registry System / Facility Registry Service (FRS) No. – 110043333372
  - Source Classification Code (SCC) – 20100209

1.2.5 Equipment Tested
- General Electric, 7F.05, Unit #U-00003
  - NOx Analyzer (TAPI T200M, Serial No. 1014)
  - NH_3 Analyzer (TAPI T200M, Serial No. 1049)
  - CO Analyzer (TAPI T300M, Serial No. 520)
  - O_2 Analyzer (TAPI T803, Serial No. 151)

1.2.6 Emission Points
- Exhaust from the General Electric, 7F.05, Unit #U-00003
- For all gases, one sample point in the exhaust duct from the General Electric, 7F.05, Unit #U-00003, determined after conducting a stratification test

1.2.7 Emission Parameters Measured
- NOx
- CO
- NH_3
- O_2

1.2.8 Date of Emission Test
- April 4, 2020

1.2.9 Federal Certifications

- Stack Testing Accreditation Council AETB Certificate No. 3796.02
- International Standard ISO/IEC 17025:2005 Certificate No. 3796.01

2.0 SUMMARY OF TEST RESULTS

Results from the sampling conducted on Cricket Valley Energy Center, LLC's General Electric, 7F.05, Unit #U-00003 located at the Cricket Valley Energy Center on April 4, 2020 are summarized in the following table and relate only to the items tested.

TABLE 2.1
SUMMARY OF GENERAL ELECTRIC, 7F.05, UNIT #U-00003 RATA RESULTS

Pollutant	Units	Criteria			Results	Passed / Test Frequency
		CFR	Specification / Section	Standard		
NOx	ppmvd@15%O_2	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 14.33%	YES / ANNUAL
NOx	lb/hr	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	RA = 11.59%	YES / ANNUAL
NOx	lb/MMBtu	Part 75	Appendix A, Section 3.3.2(a),(b) Appendix B, Section 2.3.1.2(a),(f), Figure 2	RA ≤ 10%, or if lb/MMBtu ≤ 0.200, d ≤ ±0.020 lb/MMBtu Annual Incentive RA ≤ 7.5%, or if lb/MMBtu ≤ 0.2, d ≤ ±0.015 lb/MMBtu	RA = 15.05% RM = 0.01 lb/MMBtu d = -0.001 lb/MMBtu BAF=1.000	YES / ANNUAL
O_2	%vd	Part 60	Appendix B, Performance Specification 3, Section 13.2	RA ≤ 20%, or d ≤ ±1.0%	RA = 0.08% d = 0.0 %	YES / ANNUAL
CO	ppmvd@15%O_2	Part 60	Appendix B, Performance Specification 4, 4A, from all Section 13.2	RA ≤ 10%, or d + 2.5% CC ≤ ±5 ppmv, or ARA ≤ 5%	RA = 131.72% |d|+2.5%CC = 0.2 ppm	YES / ANNUAL
CO	lb/hr	Part 60	Appendix B, Performance Specification 4, 4A Section 13.2	RA ≤ 10%, or d + 2.5% CC ≤ ±5 lb/hr, or ARA ≤ 5%	RA = 131.78% |d|+2.5%CC = 0.2 ppm (|d|+2.5%CC = 0.9 lb/hr)	YES / ANNUAL
NH_3	ppmvd@15%O_2	Assumed Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	ARA = 4.34%	YES / ANNUAL
NH_3	lb/hr	Part 60	Appendix B, Performance Specification 2, Section 13.2	RA ≤ 20%, or ARA ≤ 10%	ARA = 3.84%	YES / ANNUAL
Load	MW	Part 60	Appendix B, Performance Specifications	> 50% max load	351.5	WITHIN TOLERANCE
Load	MW	Part 75	Appendix A and B	normal load range	351.5	WITHIN TOLERANCE

Notes: RA = relative accuracy, ARA = alternative relative accuracy, RM = reference method value, d = difference between RM and CEMS value, CC = confidence coefficient, v = velocity, BAF = bias adjustment factor

The RATA passed for all pollutants (NOx, CO, NH_3, and O_2) in all units (ppm@15%O_2, lb/hr, lb/MMBtu, and %) under all 40 CFR 60 and 40 CFR 75 criteria.

Specifically, NOx in units of ppm@15%O_2 and lb/hr, passed 40 CFR 60 criteria with an RA less than 20 percent. NOx in units of lb/MMBtu passed the 40 CFR 75 alternative annual incentive criteria with an emissions rate of less than 0.200 lb/MMBtu and a difference between the RM and CEMS analyzers of less than 0.015 lb/MMBtu. Also the Bias Adjustment Factor test resulted in an adjustment factor equal to 1.0 (no adjustment required). O_2 in units of % passed the 40 CFR 60 criteria with an RA less than 20 percent. CO in units of ppm@15%O_2 and lb/hr passed the 40 CFR 60 alternative criteria with a concentration difference between the RM and CEMS analyzers plus the confidence coefficient of less than 5 ppm and 5 lb/hr respectively. NH_3 in units of ppm@15%O_2 and lb/hr passed the 40 CFR 60 alternative criteria with an ARA less than 10 percent.

Unit load was within the 40 CFR 60 required criteria of greater than 50 percent of the maximum load and also fell within the normal load criteria as defined by the plants Quality Control and Monitoring Plan which defined the upper and lower boundary on the unit and the normal and secondary normal load ranges.

The results of all measured pollutant emissions were below the required limits. All testing was performed without any real or apparent errors. All testing was conducted according to the approved testing protocol.

3.0 SOURCE OPERATION

3.1 PROCESS DESCRIPTION

Cricket Valley Energy Center, LLC (CVEC) owns and operates the Cricket Valley Energy Center located at 2241 ST RTE 22 in Dover Plains, New York. Located on the Cricket Valley Energy Center are three General Electric (GE) 7F.05 Combustion Turbine Generators (CTGs), designated as U-00001, U-00002, and U-0003, and each unit is equipped with one heat recovery steam generator (HRSG) with supplemental duct firing. Each unit is rated at 381 megawatts (MW). The nominal MW per unit as per the NYSDEC Permit ID 3-1326-00275/00009 is identified as 333 MW.

A single, dedicated dry extraction based continuous emissions monitoring system (CEMS) is installed on each unit. The CEMS configurations include nitrogen oxide (NOx) analyzers, ammonia (NH_3) analyzers, carbon monoxide (CO) analyzers, diluent gas oxygen (O_2) analyzers, and data acquisition and handling systems (DAHS).

3.2 SAMPLING LOCATION

The CTG stack is vertical, circular, and measures 19 feet (ft) (228 inches) in diameter at the test ports which are approximately 265.8 ft above grade level with an exit elevation of approximately 282.5 ft above grade level. The test ports are located approximately 70.8 ft (850 inches) downstream and approximately 16.7 ft (200.4 inches) upstream from the nearest disturbances. Air Hygiene has field verified the measurable dimensions. Non-field verified dimensions are provided by Cricket Valley Energy Center, LLC. All exhaust samples for gaseous emissions were continuously drawn from the exhaust system at the sample ports from a single point determined after conducting a stratification test. During the stratification test three points were traversed from each of the four ports. The probe was allowed to remain at a point for two times the system response time.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

4.1 TEST METHODS

The emission test on the General Electric, 7F.05, Unit #U-00003 at the Cricket Valley Energy Center was performed following United States Environmental Protection Agency (EPA) methods described by the Code of Federal Regulations (CFR). Table 4.1 outlines the specific methods performed on April 4, 2020.

TABLE 4.1
SUMMARY OF SAMPLING METHODS

Pollutant or Parameter	Sampling Method	Analysis Method
Sample Point Location	EPA Method 1	Equal Area Method
Oxygen	EPA Method 3A	Paramagnetic Cell
Nitrogen Oxides	EPA Method 7E	Chemiluminescent Analyzer
Carbon Monoxide	EPA Method 10	Nondispersive Infrared Analyzer
Stack Flow Rate	EPA Method 19	Dry Oxygen F Factor
Ammonia and Moisture	EPA Method 320	Fourier Transform Infrared

4.2 INSTRUMENT CONFIGURATION AND OPERATIONS FOR GAS ANALYSIS

The sampling and analysis procedures used during these tests conform with the methods outlined in the Code of Federal Regulations (CFR), Title 40, Part 60, Appendix A, Methods 1, 3A, 7E, 10, 19; and 40 CFR 63, Appendix A, Method 320.

Figure 4.1 depicts the sample system used for the real-time gas analyzer tests. The gas sample was continuously pulled through the probe and transported, via heat-traced Teflon® tubing, to a heated head pump and into the FTIR then to a stainless steel minimum-contact condenser designed to dry the sample. Transportation of the sample, through Teflon® tubing, continued into the sample manifold within the mobile laboratory / portable analyzer via a stainless steel/Teflon® diaphragm pump. From the manifold, the sample was partitioned to the real-time analyzers through rotameters that controlled the flow rate of the sample.

Figure 4.1 shows that the sample system was also equipped with a separate path through which a calibration gas could be delivered to the probe and back through the entire sampling system. This allowed for convenient performance of system bias checks as required by the testing methods.

All instruments were housed in a climate controlled, trailer-mounted mobile laboratory. Gaseous calibration standards were provided in aluminum cylinders with the concentrations certified by the vendor. EPA Protocol No. 1 was used to determine the cylinder concentrations where applicable (i.e. NOx calibration gases).

Table 4.2 provides a description of the analyzers used for the instrument portion of the tests. All data from the continuous monitoring instruments were recorded on a Logic Beach Portable Data Logging System which retrieves calibrated electronic data from each instrument every one second and reports an average of the collected data every 30 seconds. For target compounds measured with the Fourier transform infrared (FTIR) spectrometer, interferograms consisting of 28 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations. Spectral data was analyzed by the MKS MG2000 software.

Ten test runs of approximately 21 minutes each were conducted on the General Electric, 7F.05, Unit #U-00003 for NOx, CO, NH_3, and O_2.

The stack gas analysis for O_2 concentrations was performed in accordance with procedures set forth in EPA Method 3A. The O_2 analyzer uses a paramagnetic cell detector.

EPA Method 7E was used to determine concentrations of NOx. A chemiluminescent analyzer was used to determine the nitrogen oxides concentration in the gas stream. A NO_2 in nitrogen certified gas cylinder was used to verify at least a 90 percent NO_2 conversion on the day of the test.

CO emission concentrations were quantified in accordance with procedures set forth in EPA Method 10. A continuous nondispersive infrared (NDIR) analyzer was used for this purpose.

An MKS Instruments - MultiGas™ Fourier Transform Infrared (FTIR) spectrometer, or equivalent, was used for NH_3 and H_2O analysis per EPA Method 320. The FTIR spectrometer spectral resolution was 0.5 cm^{-1}. The system employed a silicon carbide infrared source at 1200ºC, a helium neon reference laser, beam splitters, potassium bromide (KBr) cell window, front-surface optical transfer mirrors, and multi-pass absorption cells. MCT detectors were used and cooled with liquid nitrogen in order to maintain a constant temperature of 77 Kelvin. The approximately 5.11-meter multi-pass path cells incorporated aspheric, aberration-correcting mirrors to increase the optical throughput and the detection sensitivity. Transducers and thermocouples were connected directly to the insulated sample cells that provide the pressure and temperatures of the sample streams. During testing, the temperature of the absorption cells was set at 191ºC. Elevated temperature prevented gas condensation within the cell and minimized compound adhesion to the cell walls and mirrors. The volume of the absorption cell was 0.5 liters, so at a sample gas flow rate of 4.0 liters per minute, the sample gas in the cell is refreshed approximately four times each minute. Interferograms consisting of 28 co-added scans were recorded continuously during the test periods, and provided approximately 30-second average concentrations.

TABLE 4.2
ANALYTICAL INSTRUMENTATION

Parameter	Manufacturer and Model	Range	Sensitivity	Detection Principle
NOx	THERMO 42 series	User may select up to 5,000 ppm	0.1 ppm	Thermal reduction of NO_2 to NO. Chemiluminescence of reaction of NO with O_3. Detection by PMT. Inherently linear for listed ranges.
CO	THERMO 48 series	User may select up to 10,000 ppm	0.1 ppm	Infrared absorption, gas filter correlation detector, microprocessor based linearization.
NH_3 and H_2O	MKS 2030	User may select from multiple ranges	0.1 ppm	Fourier Transform Infrared – FTIR
O_2	SERVOMEX 1440	0-25%	0.1%	Paramagnetic cell, inherently linear.

Relative Accuracy = 14.3%

Part 60, Appendix B, Performance Specification 2,
8.4.1 RA Test Period. Conduct the RA test according to the procedure given in Sections 8.4.2 through 8.4.6 while the affected facility is operating at more than 50 percent of normal load, or as specified in an applicable subpart.
13.2 Relative Accuracy Performance Specification. The RA of the CEMS must be no greater than 20 percent when RM is used in the denominator of Eq. 2-6 (average emissions during test are greater than 50 percent of the emission standard) or 10 percent when the applicable emission standard (permit limit) is used in the denominator of Eq. 2-6 (average emissions during test are less than 50 percent of the emission standard).
Eq. 2.6 RA=([|d|+|CC|]*100)/RM

Part 60, Appendix B, Performance Specification 4,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS having span values of 1,000 ppmv CO.
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA or 5 percent when the applicable emission standard (permit limit) is used to calculate RA.

Part 60, Appendix B, Performance Specification 4A,
1.2.1 This specification is for evaluating the acceptability of carbon monoxide (CO) continuous emission monitoring systems (CEMS) at the time of installation or soon after and whenever specified in an applicable subpart of the regulations. This specification was developed primarily for CEMS that comply with low emission standards (less than 200 ppmv).
13.2 Relative Accuracy. The RA of the CEMS must be no greater than 10 percent when the average RM value is used to calculate RA, 5 percent when the applicable emission standard (permit limit) is used to calculate RA, or within 5 ppmv when the RA is calculated as the absolute average difference between the RM and CEMS plus the 2.5 percent confidence coefficient.

T-value	2.306
Confidence Coefficient	0.0001

Relative Accuracy = 15.05%

If the mean difference is less than or equal to the absolute value of the confidence coefficient, then the Bias Test passes and the bias adjustment factor is not applicable.

Mean Difference =	-0.0007
Confidence Coefficient =	0.0001

BAF = 1 + (abs. value mean difference/avg. CEMS reading)

Average CEMS Reading =	0.0062
BAF =	**1.000**

Part 75, Appendix A,
3.3.2 Relative Accuracy for NOX-Diluent Continuous Emission Monitoring Systems
(a) The relative accuracy for NOX-diluent continuous emission monitoring systems shall not exceed 10.0 percent.
(b) For affected units where the average of the reference method measurements of NOX emission rate (this means lb/MMBtu) during the relative accuracy test audit is less than or equal to 0.200 lb/mmBtu, the difference between the mean value of the continuous emission monitoring system measurements and the reference method mean value shall not exceed ±0.020 lb/mmBtu, wherever the relative accuracy specification of 10.0 percent is not achieved.

7.6.5 Bias Adjustment
(b) For single-load RATAs of SO2 pollutant concentration monitors, NOX concentration monitoring systems, and NOX-diluent monitoring systems and for the single-load flow RATAs required or allowed under section 6.5.2 of this appendix and sections 2.3.1.3(b) and 2.3.1.3(c) of Appendix B to this part, the appropriate BAF is determined directly from the RATA results at normal load, using Equation A-12. Notwithstanding, when a NOX concentration CEMS or an SO2 CEMS or a NOX-diluent CEMS installed on a low-emitting affected unit (i.e., average SO2 or NOX concentration during the RATA ≦ 250 ppm or average NOX emission rate ≦ 0.200 lb/mmBtu) meets the normal 10.0 percent relative accuracy specification (as calculated using Equation A-10) or the alternate relative accuracy specification in section 3.3 of this appendix for low-emitters, but fails the bias test, the BAF may either be determined using Equation A-12, or a default BAF of 1.111 may be used.

Part 75, Appendix B,
2.3.1.2 Reduced RATA Frequencies. Relative accuracy test audits of primary and redundant backup SO2 pollutant concentration monitors, CO2 pollutant concentration monitors (including O2 monitors used to determine CO2 emissions), CO2 or O2 diluent monitors used to determine heat input, moisture monitoring systems, NOX concentration monitoring systems, flow monitors, NOX-diluent monitoring systems or SO2-diluent monitoring systems may be performed annually (i.e., once every four successive QA operating quarters, rather than once every two successive QA operating quarters) if any of the following conditions are met for the specific monitoring system involved:
(a) The relative accuracy during the audit of an SO2 or CO2 pollutant concentration monitor (including an O2 pollutant monitor used to measure CO2 using the procedures in appendix F to this part), or of a CO2 or O2 diluent monitor used to determine heat input, or of a NOX concentration monitoring system, or of a NOX-diluent monitoring system, or of an SO2-diluent continuous emissions monitoring system is ≤ 7.5 percent;

(f) For units with low NOX emission rates (average NOX emission rate measured by the reference method during the RATA ≤ 0.200 lb/mmBtu), when a NOX-diluent continuous emission monitoring system fails to achieve a relative accuracy ≤ 7.5 percent, but the monitoring system mean value from the RATA, calculated using Equation A-7 in appendix A to this part, is within ± 0.015 lb/mmBtu of the reference method mean value;

Figure 2 to Appendix B of Part 75_Relative Accuracy Test Frequency Incentive System.

RATA	Semiannual(percent)(1)	Annual(1)
SO2 or NOX(3)	7.5% < RA ≤ 10.0% or ± 15.0 ppm(2)	RA ≤ 7.5% or ± 12.0 ppm(2)
SO2-diluent	7.5% < RA ≤ 10.0% or ± 0.030 lb/mmBtu(2)	RA ≤ 7.5% or ± 0.025 lb/mmBtu(2)
NOX-diluent	7.5% < RA ≤ 10.0% or ± 0.020 lb/mmBtu(2)	RA ≤ 7.5% or ± 0.015 lb/mmBtu(2)
Flow	7.5% < RA ≤ 10.0% or ± 2.0 fps(2)	RA ≤ 7.5% or ± 1.5 fps
CO2 or O2	7.5% < RA ≤ 10.0% or ± 1.0% CO2/O2(2)	RA ≤ 7.5% or ± 0.7% CO2/O2(2)
Moisture	7.5% < RA ≤ 10.0% or ± 1.5% H2O(2)	RA ≤ 7.5% or ± 1.0% H2O(2)

(1) The deadline for the next RATA is the end of the second (if semiannual) or fourth (if annual) successive QA operating quarter following the quarter in which the CEMS was last tested. Exclude calendar quarters with fewer than 168 unit operating hours (or, for common stacks and bypass stacks, exclude quarters with fewer than 168 stack operating hours) in determining the RATA deadline. For SO2 monitors, QA operating quarters in which only very low sulfur fuel as defined in § 72.2, is combusted may also be excluded. However, the exclusion of calendar quarters is limited as follows: the deadline for the next RATA shall be no more than 8 calendar quarters after the quarter in which a RATA was last performed.
(2) The difference between monitor and reference method mean values applies to moisture monitors, CO2, and O2 monitors, low emitters, or low flow, only.
(3) A NOX concentration monitoring system used to determine NOX mass emissions under § 75.71.

Calculations, Formulas, and Constants

The following information supports the spreadsheets for this testing project.

Given Data:

Ideal Gas Conversion Factor = 385.23 SCF/lb-mol at 68 deg F & 14.696 psia

Fuel Heating Value is based upon Air Hygiene's fuel gas calculation sheet. All calculations are based upon a correction to 68 deg F & 14.696 psia

High Heating Values (HHV) are used for the Fuel Heating Value, F-Factor, and Fuel Flow Data per EPA requirements.

1. Corrected Raw Average (C_{Gas}), 40CFR60, App. A, RM 7E, Eq. 7E-5 (08/15/06)

$$C_{Gas} = (C_{Avg} - C_O) \times \left(\frac{C_{MA}}{C_M - C_O} \right)$$

2. Correction to % O_2, 40CFR60, App. A, RM 20, Eq. 20-5 (11/26/02)

$$C_{adj} = C_{Gas(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas(O2)}} \right)$$

3. Correction to % O_2 and ISO Conditions

$$C_{ISO} = C_{Adj} \times \sqrt{\frac{P_r}{P_o}} \times e^{(19 \times (H_O - 0.00633))} \times \left(\frac{288}{T_a} \right)^{1.53}$$

4. Method 19 stack exhaust flow (scfh) [ref. EPA EMC FAQ Method 19]

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000} \right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas(O2)}} \right)$$

5. Emission Rate in lb/hr

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

6. Emission Rate in tons per year

$$E_{ton/yr} = \frac{E_{lb/hr} \times hr_{year}}{2000}$$

7. Emission Concentration in lb/MMBtu (O_2 based)

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$

8. Emission Concentration in g/hp*hr

$$E_{g/hp \cdot hr} = \frac{E_{lb/hr} \times 453.6}{mw \times 1341.022} or \frac{E_{lb/hr} \times 453.6}{hp}$$

RATA SHEET CALCULATIONS

d = Reference Method Data - CEMS Data

S_d = Standard Deviation

CC = Confident Coefficient

n = number of runs

$t_{0.025}$ = 2.5 percent confidence coefficient T-values

RA = relative accuracy

ARA = alternative relative accuracy

BAF = Bias adjustment factor

n	t	n	t	n	t
2	12.706	7	2.447	12	2.201
3	4.303	8	2.365	13	2.179
4	3.182	9	2.306	14	2.160
5	2.776	10	2.262	15	2.145
6	2.571	11	2.228	16	2.131

1. Difference

$$d = \sum_{i=1}^{n} d_i$$

2. Standard Deviation

$$S_d = \sqrt{\frac{\sum_{i=1}^{n} d_i^2 - \left[\frac{\left(\sum_{i=1}^{n} d_i \right)^2}{n} \right]}{n-1}}$$

3. Confident Coefficient

$$CC = t_{0.025} \times \frac{S_d}{\sqrt{n}}$$

4. Relative Accuracy

$$RA = \frac{|d_{AVG}| + |CC|}{RM_{AVG}} \times 100$$

5. Alternative Relative Accuracy

$$ARA = \frac{|d_{AVG}| + |CC|}{AS} \times 100$$

5. Bias Adjustment Factor

$$BAF = 1 + \left(\frac{|d_{AVG}|}{CEM_{AVG}} \right)$$

RM 7E, (08-15-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

ACE = Analyzer calibration error, percent of calibration span.
B_{WS} = Moisture content of sample gas as measured by Method 4 or other approved method, percent/100.
C_{Avg} = Average unadjusted gas concentration indicated by data recorder for the test run.
C_D = Pollutant concentration adjusted to dry conditions.
C_{Dir} = Measured concentration of a calibration gas (low, mid, or high) when introduced in direct calibration mode.
C_{Gas} = Average effluent gas concentration adjusted for bias.
C_M = Average of initial and final system calibration bias (or 2-point system calibration error) check responses for the upscale calibration gas.
C_{MA} = Actual concentration of the upscale calibration gas, ppmv.
C_O = Average of the initial and final system calibration bias (or 2-point system calibration error) check responses from the low-level (or zero) calibration gas.
C_S = Measured concentration of a calibration gas (low, mid, or high) when introduced in system calibration mode.
C_{SS} = Concentration of NOx measured in the spiked sample.
C_{Spike} = Concentration of NOx in the undiluted spike gas.
C_{Calc} = Calculated concentration of NOx in the spike gas diluted in the sample.
C_V = Manufacturer certified concentration of a calibration gas (low, mid, or high).
C_W = Pollutant concentration measured under moist sample conditions, wet basis.
CS = Calibration span.
D = Drift assessment, percent of calibration span.
E_p = The predicted response for the low-level and mid-level gases based on a linear response line between the zero and high-level response.
Eff_{NO2} = NO_2 to NO converter efficiency, percent.
H = High calibration gas, designator.
L = Low calibration gas, designator.
M = Mid calibration gas, designator.
NOFinal = The average NO concentration observed with the analyzer in the NO mode during the converter efficiency test in Section 16.2.2.
NOxCorr = The NOx concentration corrected for the converter efficiency.
NOxFinal = The final NOx concentration observed during the converter efficiency test in Section 16.2.2.
NOxPeak = The highest NOx concentration observed during the converter efficiency test in Section 16.2.2.
Q_{Spike} = Flow rate of spike gas introduced in system calibration mode, L/min.
Q_{Total} = Total sample flow rate during the spike test, L/min.
R = Spike recovery, percent.
SB = System bias, percent of calibration span.
SB_i = Pre-run system bias, percent of calibration span.
SB_f = Post-run system bias, percent of calibration span.
SB / D_{Alt} = Alternative absolute difference criteria to pass bias and/or drift checks.
SCE = System calibration error, percent of calibration span.
SCE_i = Pre-run system calibration error, percent of calibration span.
SCE_{final} = Post-run system calibration error, percent of calibration span.
Z = Zero calibration gas, designator.

40CFR60.355(b)(1), (09-20-06), Nomenclature. The terms used in the equations are defined as follows:

P_r = reference combustor inlet absolute pressure at 101.3 kilopascals ambient pressure, mm Hg
P_o = observed combustor inlet absolute pressure at test, mm Hg
H_o = observed humidity of ambient air, g H_2O/g air
e = transcendental constant, 2.718
T_a = ambient temperature, K

Small Engine and FTIR Nomenclature. The terms used in the equations are defined as follows:

bhp = brake horsepower
hp = horsepower
Q_{sys} = system flow (lpm)
Q_m = matrix spike flow (lpm)

RM 19, (07-29-06), 12.1 Nomenclature. The terms used in the equations are defined as follows:

AdjFactor = Percent oxygen or carbon dioxide adjustment applied to a target pollutant
B_{wa} = Moisture fraction of ambient air, percent.
Btu = British thermal unit
$\%_C$ = Concentration of carbon from an ultimate analysis of fuel, weight percent.
$\%_{CO2d}$,$\%_{CO2w}$ = Concentration of carbon dioxide on a dry and wet basis, respectively, percent.
CIP / CDP = Combustor inlet pressure / compressor discharge pressure (mm Hg); note, some manufactures reference as PCD.
E = Pollutant emission rate, ng/J (lb/million Btu).
E_a = Average pollutant rate for the specified performance test period, ng/J (lb/million Btu).
E_{ao}, E_{ai} = Average pollutant rate of the control device, outlet and inlet, respectively, for the performance test period, ng/J (lb/million Btu).
E_{bi} = Pollutant rate from the steam generating unit, ng/J (lb/million Btu).
E_{bo} = Pollutant emission rate from the steam generating unit, ng/J (lb/million Btu).
E_{ci} = Pollutant rate in combined effluent, ng/J (lb/million Btu).
E_{co} = Pollutant emission rate in combined effluent, ng/J (lb/million Btu).
E_d = Average pollutant rate for each sampling period (e.g.,24-hr Method 6B sample or 24-hr fuel sample) or for each fuel lot (e.g., amount of fuel bunkered), ng/J (lb/million Btu).
E_{di} = Average inlet SO_2 rate for each sampling period d, ng/J (lb/million Btu).
E_g = Pollutant rate from gas turbine, ng/J (lb/million Btu).
E_{ga} = Daily geometric average pollutant rate, ng/J (lbs/million Btu) or ppm corrected to 7 percent O_2.
E_{jo},E_{ji} = Matched pair hourly arithmetic average pollutant rate, outlet and inlet, respectively, ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
E_h = Hourly average pollutant, ng/J (lb/million Btu).
E_{hj} = Hourly arithmetic average pollutant rate for hour "j," ng/J (lb/million Btu) or ppm corrected to 7 percent O_2.
EXP = Natural logarithmic base (2.718) raised to the value enclosed by brackets.
Fc = Ratio of the volume of carbon dioxide produced to the gross calorific value of the fuel from Method 19
F_d, F_w, F_c = Volumes of combustion components per unit of heat content, scm/J (scf/million Btu).
ft^3 = cubic feet
G = ideal gas conversion factor
(385.23 SCF/lb-mol at 68 deg F & 14.696 psia)
GCM = gross Btu per SCF (constant, compound based)
GCV = Gross calorific value of the fuel consistent with the ultimate analysis, kJ/kg (Btu/lb).
GCV_p, GCV_r = Gross calorific value for the product and raw fuel lots, respectively, dry basis, kJ/kg (Btu/lb).
$\%_H$ = Concentration of hydrogen from an ultimate analysis of fuel, weight percent.
H_b = Heat input rate to the steam generating unit from fuels fired in the steam generating unit, J/hr (million Btu/hr).
H_g = Heat input rate to gas turbine from all fuels fired in the gas turbine, J/hr (million Btu/hr).
$\%_{H2O}$ = Concentration of water from an ultimate analysis of fuel, weight percent.
H_r = Total numbers of hours in the performance test period (e.g., 720 hours for 30-day performance test period).
K = volume of combustion component per pound of component (constant)
K = Conversion factor, 10^{-5} (kJ/J)/(%) [10^6 Btu/million Btu].
K_c = (9.57 scm/kg)/% [(1.53 scf/lb)/%].
K_{cc} = (2.0 scm/kg)/% [(0.321 scf/lb)/%].
K_{hd} = (22.7 scm/kg)/% [(3.64 scf/lb)/%].
K_{hw} = (34.74 scm/kg)/% [(5.57 scf/lb)/%].
K_n = (0.86 scm/kg)/% [(0.14 scf/lb)/%].
K_o = (2.85 scm/kg)/% [(0.46 scf/lb)/%].
K_s = (3.54 scm/kg)/% [(0.57 scf/lb)/%].
K_{sulfur} = $2x10^4$ Btu/wt%-MMBtu
K_w = (1.30 scm/kg)/% [(0.21 scf/lb)/%].
lb = pound
ln = Natural log of indicated value.
L_p,L_r = Weight of the product and raw fuel lots, respectively, metric ton (ton).
$\%_N$ = Concentration of nitrogen from an ultimate analysis of fuel, weight percent.
$M_{\%}$ = mole percent
mol = mole
MW = molecular weight (lb/lb-mol)
MW_{AIR} = molecular weight of air (28.9625 lb/lb-mole)[1]
NCM = net Btu per SCF (constant based on compound)
$\%_O$ = Concentration of oxygen from an ultimate analysis of fuel, weight percent.
$\%_{O2d}$, $\%_{O2w}$ = Concentration of oxygen on a dry and wet basis, respectively, percent.
P_B = barometric pressure, in Hg
P_s = Potential SO2 emissions, percent.
$\%_S$ = Sulfur content of as-fired fuel lot, dry basis, weight percent.
S_e = Standard deviation of the hourly average pollutant rates for each performance test period, ng/J (lb/million Btu).
$\%_{Sf}$ = Concentration of sulfur from an ultimate analysis of fuel, weight percent.
S(wt%) = weight percent of sulfur, per lab analysis by appropriate ASTM standard
S_i = Standard deviation of the hourly average inlet pollutant rates for each performance test period, ng/J (lb/million Btu).
S_o = Standard deviation of the hourly average emission rates for each performance test period, ng/J (lb/million Btu).
$\%S_p$, $\%S_r$ = Sulfur content of the product and raw fuel lots respectively, dry basis, weight percent.
SCF = standard cubic feet
SH = specific humidity, pounds of water per pound of air
$t_{0.95}$ = Values shown in Table 19-3 for the indicated number of data points n.
T_{amb} = ambient temperature, °F
W/D Factor = 1.0236 = conv. at 14.696 psia and
68 deg F (ref. Civil Eng. Ref. Manual, 7th Ed.)
X_{CO2}=CO_2 Correction factor, percent.
X_k = Fraction of total heat input from each type of fuel k.

EXAMPLE CALCULATIONS (INFORMATION)

Specific Humidity (RH_{sp})

Note: RHsp (gr/lb) calculated using temperature, relative humidity, and barometric pressure with psychrometric chart, psychrometric calculator, or built in psychrometric algorithm.

$$RH_{sp}(lb/lb) = \left[\left(\frac{gr}{lb}\right) \times \frac{lb}{7000\ gr}\right]$$

RH_{sp}= 36.54 gr / lb x 1 lb / 7000 gr = 0.005221 lb H_2O / lb Air

EXAMPLE CALCULATIONS (CALIBRATION)

Analyzer Calibration Error

RM 7E, (02-27-14), 12.2 Analyzer Calibration Error. For non-dilution systems, use Equation 7E-1 to calculate the analyzer calibration error for the low-, mid-, and high-level calibration gases. (calc for NOx analyzer mid gas, if applicable)

$$ACE = \left(\frac{C_{Dir} - C_V}{CS}\right) \times 100$$ Eq. 7E-1

ACE = (4.56 ppm - 4.55 ppm) / 8.90 ppm x 100 = 0.11 %

EXAMPLE CALCULATIONS (BIAS, DRIFT, AND CORRECTED RAW AVERAGE)

System Bias

RM 7E, (02-27-14), 12.3 System Bias. For non-dilution systems, use Equation 7E-2 to calculate the system bias separately for the low-level and upscale calibration gases. (calc for NOx analyzer upscale gas, Run 1 initial bias, if applicable)

$$SB = \left(\frac{C_S - C_{Dir}}{CS}\right) \times 100$$ Eq. 7E-2

SB = (4.58 ppm - 4.56 ppm) / 8.90 ppm x 100 = 0.22 %

Drift Assessment

RM 7E, (02-27-14), 12.5 Drift Assessment. Use Equation 7E-4 to separately calculate the low-level and upscale drift over each test run. (calc for NOx analyzer upscale drift, Run 1, if applicable)

$$D = \left|SB_{final} - SB_t\right|$$ Eq. 7E-4

D = | 0.00 % - 0.22 % | = 0.22 %

Alternative Drift and Bias

RM 7E, (02-27-14), 13.2 / 13.3 System Bias and Drift. Alternatively, the results are acceptable if |Cs – Cdir| is ≤ 0.5 ppmv or if |Cs – Cv| is ≤ 0.5 ppmv (as applicable). (calc for NOx analyzer initial upscale, Run 1, if applicable)

$$SB/D_{Alt} = \left|C_S - C_{Dir}\right|$$ Eq. Section 13.2 and 13.3

SB / D_{Alt} = | 4.58 ppm - 4.56 ppm | = 0.02 ppm

Bias Adjusted Average

RM 7E, (02-27-14), 12.6 Effluent Gas Concentration. For each test run, calculate Cavg, the arithmetic average of all valid NOx concentration values (e.g., 1-minute averages). Then adjust the value of Cavg for bias, using Equation 7E-5b. (calc for NOx analyzer, Run 1, if applicable)

$$C_{Gas} = \left(C_{Avg} - C_O\right) \times \left(\frac{C_{MA}}{C_M - C_O}\right)$$ Eq. 7E-5b

C_{Gas} = (1.96 ppm - -0.09 ppm) (4.55 ppm / 4.57 ppm - -0.09 ppm) = 2.00 ppm

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RUNS)

Stack Exhaust Flow (Q_S) - RM19

$$Q_S = \left(\frac{FFactor \times Q_f \times HHV}{1{,}000{,}000}\right) \times \left(\frac{20.9\%}{20.9\% - C_{Gas\,(O2)}}\right)$$

Note: Equation presented in EPA Emission Measurement Center (EMC), Frequently Asked Questions (FAQ) for Method 19

Q_S = 8,710.00 SCF/MMBtu x 2,322,450.00 SCF/hr x 1,050.00 Btu/SCF x MMBtu/10^6 Btu x (20.90% / (20.9% - 13.1 %)) = 56,738,224.23 SCFH

Moisture Correction

RM 7E, (02-27-14), 12.10 Moisture Correction. Use Equation 7E-10 if your measurements need to be corrected to a dry basis. (calc for NOx analyzer, Run 1, if applicable) Note: Calculations may not match as Run 1 results are typically also bias adjusted

$$C_W = C_D \times (1 - B_{WS})$$

$$C_D = \frac{C_W}{1 - B_{WS}}$$ Eq. 7E-10

C_D = 1.84 ppmvw / (1 - 0.08) = 2.00 ppmvd or inversely, C_W = 2.00 ppmvd x (1 - 0.08) = 1.84 ppmvw

Diluent-Corrected Pollutant Concentration, O_2 Based

RM 20, (11-26-02), 7.3.1 Correction of Pollutant Concentration Using O_2 Concentration. Calculate the O_2 corrected pollutant concentration, as follows: (calc for NOx gas, Run 1, if applicable) [now contained in applicable Subpart]

$$C_{adj} = C_{Gas\,(Target)} \times \left(\frac{20.9\% - AdjFactor}{20.9\% - C_{Gas\,(O2)}}\right)$$ Eq. 20-4

C_{adj} = 2.00 ppm x (20.9% - 15.00 %) / (20.9% - 13.08 %) = 1.51 ppm@15%O_2

Emissions Rate (lb/hr)

Calculation for pound per hour emission rate. Calculate, as follows: (calc for NOx gas Run 1, if applicable)

$$E_{lb/hr} = \frac{C_{Gas}}{10^6} \times \frac{Q_S \times MW}{G}$$

$E_{lb/hr}$ = 2.00 ppmvd / 10^6 ppm/part x 56,738,224 DSCFH x 46.01 lb/lb-mol / 385.23 SCF/lb-mol = 13.58 lb/hr

Emissions Rate (lb/MMBtu)

RM 19, (02-27-14), 12.2 Emission Rates of PM, SO_2, and NOx. Select from the following sections the applicable procedure to compute the PM, SO_2, or NOx emission rate (E) in ng/J (lb/million Btu). (calc for NOx gas Run 1, if applicable)

Oxygen Based

12.2.1 Oxygen-Based F Factor, Dry Basis. When measurements are on a dry basis for both O_2 ($\%O_2d$) and pollutant (Cd) concentrations, use the following equation:

$$E_{lb/MMBtu} = \frac{C_{Gas} \times F_d Factor \times Conv_C \times 20.9\%}{20.9\% - C_{Gas(O2)}}$$ Eq. 19-1

$E_{lb/MMBtu}$ = 2.00 ppm x 8,710.00 SCF/MMBtu x 0.0000001194 lb/ppm*ft^3 x 20.9% / (20.9% - 13.08 %) = 0.006 lb/MMBtu

Conversion Constant

Convc for NOx

$$Conv_c(lb/ppm \cdot ft^3) = \frac{\frac{MW}{G}}{10^6}$$

$Conv_c$ = (46.01 lb/lb•mole x lb•mole/385.23 SCF) / 10^6 = 0.0000001194 lb/ppm-ft^3

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

EXAMPLE CALCULATIONS (RATA RESULTS)

Difference (d)

40 CFR 75, App A, (12-17-09), 7.3.1 Arithmetic Mean. Calculate the arithmetic mean of the differences, d , of a data set as follows. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$d = \sum_{i=1}^{n} d_i$$ Eq. A-7

d = 0.005 lb/MMBtu - 0.006 lb/MMBtu = -0.001 lb/MMBtu

Standard Deviation

40 CFR 75, App A, (12-17-09), 7.3.2 Standard Deviation. Calculate the standard deviation, Sd, of a data set as follows:
(calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$S_d = \sqrt{\frac{\sum_{i=1}^{n} d_i^2 - \frac{\left[\left(\sum_{i=1}^{n} d_i\right)^2\right]}{n}}{n-1}}$$ Eq. A-8

$$S_d = \sqrt{\frac{0.000 \text{ lb/MMBtu}^2 - \frac{(-0.007 \text{ lb/MMBtu})^2}{9}}{9 - 1}} = 0.000 \text{ lb/MMBtu}$$

Confidence Coefficient

40 CFR 75, App A, (12-17-09), 7.3.3 Confidence Coefficient. Calculate the confidence coefficient (one-tailed), cc, of a data set as follows. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$CC = t_{0.025} \times \frac{S_d}{\sqrt{n}}$$ Eq. A-9

CC = 2.306 x $\frac{0.000 \text{ lb/MMBtu}}{\sqrt{9}}$ = 0.000 lb/MMBtu

T-Values	n	2	3	4	5	6	7	8	9
	$t_{0.025}$	12.706	4.303	3.182	2.776	2.571	2.447	2.365	2.306

2.5 percent confidence coefficients

Relative Accuracy

40 CFR 75, App A, (12-17-09), 7.3.4 Relative Accuracy. Calculate the relative accuracy of a data set using the following equation. (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$RA = \frac{|d_{AVG}| + |CC|}{RM_{AVG}} \times 100$$ Eq. A-10

RA = $\frac{|-0.001 \text{ lb/MMBtu}| + |0.000 \text{ lb/MMBtu}|}{0.005 \text{ lb/MMBtu}}$ x 100 = 15.05 %

Bias Adjustment Factor (BAF)

40 CFR 75, App A, (12-17-09), 7.6.5 Bias Adjustment. (a) If the monitor or monitoring system fails to meet the bias test requirement, adjust the value obtained from the monitor using the following equation: (calc for NOx lb/MMBtu data, if applicable. Note: This is an example calculation which may not have any bearing on the actual test requirements.)

$$BAF = 1 + \left(\frac{|d_{AVG}|}{CEM_{AVG}}\right)$$ Eq. A-12

d_{AVG}= -0.001 < |CC| = 0.000 ⇨ BAF = 1 + $\frac{|\quad| \text{ lb/MMBtu}}{\text{lb/MMBtu}}$ = 1.000 lb/MMBtu

Note: BAF only applies if the mean difference (d) is greater than the absolute value of the confidence coefficient.

Note: Lack of significant figures may cause rounding errors between actual calculations and example calculations.

CEMS AND REFERENCE METHOD DATA

CEMS Data
(provided by Cricket Valley Energy Center LLC)

Relative Accuracy Test Data
CEMS Results (NOx)
General Electric, 7F.05, Unit #U-00003

Parameter:	Oxides of Nitrogen
Date of Test:	April 4, 2020
Reference Method:	EPA Method 7E
CEMS Analyzer Type:	Chemiluminescence
Manufacturer:	TAPI
Model #:	T200M
Serial #:	1014

RUN #	RUN TIME	UNIT LOAD	CONCENTRATIONS		RATES	
		(MW)	(ppmvd)	(ppmvd@15%O_2)	(lb/hr)	(lb/MMBtu)
1	17:23 - 17:43	349.6		1.70	14.93	0.0063
2	17:52 - 18:12	349.8		1.70	14.93	0.0063
3	18:20 - 18:40	350.4		1.70	14.89	0.0062
4	18:51 - 19:11	350.7		1.70	14.88	0.0062
5	19:20 - 19:40	351.5		1.70	14.94	0.0063
6	19:48 - 20:08	351.9		1.55	13.61	0.0057
7	20:20 - 20:40	352.7		1.73	15.29	0.0064
8	20:49 - 21:09	353.0		1.60	14.13	0.0059

CERTIFICATE OF ANALYSIS
(Zero Ambient Nitrogen)

Cylinder Number:	EB0058639	**Certification Date:**	02/25/2020
Product ID Number:	121026	**Expiration Date:**	02/23/2028
Cylinder Pressure:	1900 PSIG	**MFG Facility:**	RBTGS-Shreveport-LA
COA #	EB0058639.20200225-0	**Lot Number:**	EB0058639.20200225
Customer PO. NO.:		**Tracking Number:**	074332593
Customer:		**Previous Certification Dates:**	

This mixture is for laboratory use only, not for drug, household or other use.
This mixture is certified in Mole % to be within ±2% of the actual number reported with a confidence of 95%.
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

Composing Material: Zero Ambient Nitrogen, Cert., Sz152

Component	Specification	Concentration
Nitrogen	Balance	Balance
Oxygen as Impurity	<1.0 PPM	<1.0 PPM
Carbon Dioxide as Impurity	<0.5 PPM	<0.5 PPM
Carbon Monoxide as Impurity	<0.5 PPM	<0.5 PPM
Total Oxides of Nitrogen as Impurity	<0.1 PPM	<0.1 PPM
Sulfur Dioxide as Impurity	<0.1 PPM	<0.1 PPM
Total Hydrocarbons as Impurity	<0.1 PPM	<0.1 PPM

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

APPENDIX D

QUALITY ASSURANCE AND QUALITY CONTROL DATA

QA/QC PROGRAM

AIR HYGIENE ensures the quality and validity of its emission measurement and reporting procedures through a rigorous quality assurance (QA) program. The program is developed and administered by an internal QA team and encompasses six major areas:

1. Field Qualifications
2. QA reviews of reports, laboratory work, and field testing;
3. Equipment calibration and maintenance;
4. Chain-of-custody;
5. Training; and
6. Knowledge of current test methods

Field Qualifications

Air Hygiene personnel are required to gain and maintain competence with testing methods and techniques according to their job titles and the roles they play during field testing events. Qualifications for each job description include:

Staff Technician - An entry level position with responsibility to test on the stack by performing duties that include: keep trucks and trailers stocked and clean, travel to and from job site, be the "hands of the test" on the stack; stay on a stack during the sample test, set up and tear down equipment on-site, perform maintenance on equipment in the shop and on-site.

Test Technician or Specialist - Acts as the "hands of the test" on the stack by performing duties that include: stay on a stack during the sample test, migrate to the testing trailer and learn the different analyzers and testing methods used on site, set up and tear down testing equipment on site, learn the system for testing from Testing Managers and Project Managers, travel to and from job site; including driving responsibilities under DOT requirements, follow directions of Testing Managers and Project Managers, learn the proper way to conduct on-site test of stationary stacks

Test Manager or Engineer - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Test Managers must hold at least one QSTI certificate.

Project Manager - Directs and coordinates all aspects of a successful test by performing the following duties personally or through subordinate supervisors including: operating analyzers and consoles during testing along with QA/QC procedures, supervise set up and tear down of equipment on site, writing, reviewing, and revising final test reports, working with the client or state personnel while on the job site, managing pre-test checklists and onsite testing procedures, diagnose and repair any problems that may arise with the equipment, safely operate a man lift and drive a truck with or without a trailer, act as crew leader in the field, write protocols and reports, maintain project log of services performed on the job, verify all equipment needed for a job was loaded on the trailer. Project Managers typically hold QSTI certificates in Groups 1 through 4.

QA Reviews

Air Hygiene's review procedure includes review of each source test report, along with laboratory and fieldwork, by the QA Team. The most important review is the one that takes place before a test program begins. The QA Team works closely with technical division personnel to prepare and review test protocols. Test protocol review includes selection of appropriate test procedures, evaluation of interferences or other restrictions that might preclude use of standard test procedures, and evaluation and/or development of alternate procedures.

Equipment Calibration and Maintenance

The equipment used to conduct the emission measurements is maintained according to the manufacturer's instructions to ensure proper operation. In addition to the maintenance program, calibrations are carried out on each measurement device according to the schedule outlined by the Environmental Protection Agency. Quality control checks are also conducted in the field for each test program. In conformance with ASTM D7036 Section 15.3.15, all metering and monitoring equipment meets or exceeds the uncertainty criteria contained in the method language that pertains to that equipment.

Chain-of-Custody

Air Hygiene maintains full chain-of-custody documentation on all samples and data sheets. In addition to normal documentation of changes between field sample custodians, laboratory personnel, and field test personnel, Air Hygiene documents every individual who handles any test component in the field (e.g., probe wash, impinger loading and recovery, filter loading and recovery, etc.). Samples are stored in a locked area to which only Air Hygiene personnel have access. Field data sheets are secured at Air Hygiene's offices upon return from the field.

Training

Personnel's training is essential to ensure quality testing. Air Hygiene has formal and informal training programs, which include:

1. Attendance at EPA-sponsored training courses
2. Enrollment in EPA correspondence courses
3 A requirement for all technicians to read and understand Air Hygiene's QA manual
4. In-house training and QA meetings on a regular basis
5. Maintenance of training records

Knowledge of Current Test Methods

With the constant updating of standard test methods and the wide variety of emerging test procedures, it is essential that any qualified source tester keep abreast of new developments. Air Hygiene subscribes to services, which provide updates on EPA reference methods, rules, and regulations. Additionally, source test personnel regularly attend and present papers at testing and emission-related seminars and conferences. Air Hygiene personnel maintain membership in the Air and Waste Management Association and the American Industrial Hygiene Association.

Reproduction and Distribution Policy

Reproducing portions of this test report may omit critical or substantial documentation or be taken out of context and due care must be exercised in this regard. Furthermore, this test report and its associated data shall not be reproduced in full or in part without the written consent of the customer.

Data Provided by Client

Data provided by the Client is clearly identified in the report. Air Hygiene accepts data provided by the Client as accurate.

COMBUSTION TESTING QUALITY ASSURANCE ACTIVITIES

In conformance with ASTM D7036 Section 15.3.11 and 13, all testing was performed without any real or apparent errors, with the exception of those that would be listed in Section 2.0 of this report. In addition, all testing was conducted according to the approved testing protocol, test methods, Air Hygiene Quality Manual, or ASTM D7036, with the exception of specifics noted in Section 2.0 of this report. A number of quality assurance activities were undertaken before, during, and after this testing project. This section of the report combined with the documentation in Appendix C describes each of those activities.

Each instrument's response was checked and adjusted in the field prior to the collection of data via multi-point calibration. The instrument's linearity was checked by adjusting its zero and span responses to zero nitrogen and an upscale calibration gas in the range of the expected concentrations. The instrument response was then challenged with other calibration gases of known concentration and accepted as being linear if the response of the other calibration gases agreed within plus or minus two percent of the range of predicted values. NO_2 to NO conversion was checked via direct connect with an EPA Protocol certified concentration of NO_2 in a balance of air or nitrogen. Conversion was verified to be between 90 and 110 percent.

After each test run, the analyzers were checked for zero and span drift. This allowed each test run to be bracketed by calibrations and documents the precision of the data just collected. The criterion for acceptable data is that the instrument drift is no more than three percent of the full-scale response. The quality assurance worksheets in the following pages summarize all multipoint calibration checks and zero to span checks performed during the tests. These worksheets (as prepared from the data records of Appendix A) show that no drifts in excess of three percent occurred in the zero to span checks following each test run.

The sampling systems were leak checked by demonstrating that a vacuum greater than 10 in Hg could be held for at least one minute with a decline of less than one inch of Hg. A leak test was conducted after the sample system was set up and before the system was dismantled. This test was conducted to ensure that ambient air had not diluted the sample. Any leakage detected prior to the tests would be repaired and another leak check conducted before testing commenced. No leaks were found during the pre or post-test leak checks.

The absence of leaks in the sampling system was also verified by a sampling system bias check. The sampling system's integrity was tested by comparing the responses of the analyzers to the calibration gases introduced via two paths. The first path was directly into the analyzer and the second path via the sample system at the sample probe. Any difference in the instrument responses by these two methods was attributed to sampling system bias or leakage. The criterion for acceptance is agreement within five percent of the span of the analyzer.

The control gases used to calibrate the instruments were analyzed and certified by the compressed gas vendors to plus or minus one percent accuracy for all gases. EPA Protocol No. 1 was used, where applicable to assign the concentration values traceable to the National Institute of Standards and Technology (NIST), Standard Reference Materials (SRM's). The gas calibration sheets as prepared by the vendor are contained in Appendix C.

Air Hygiene collected and reported the enclosed test data in accordance with the procedures and quality assurance activities described in this test report. Air Hygiene makes no warranty as to the suitability of the test methods. Air Hygiene also assumes no liability relating to the interpretation and use of the test data.

Accredited Laboratory

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

Broken Arrow, OK

for technical competence in the field of

Environmental Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 *General requirements for the competence of testing and calibration laboratories*. This laboratory also meets the A2LA *R219 – Specific Requirements – TNI Field Sampling and Measurement Organization Accreditation Program*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (*refer to joint ISO-ILAC-IAF Communiqué dated April 2017*).

Presented this 18th day of December 2019

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.01
Valid to August 31, 2021

For the tests to which this accreditation applies, please refer to the laboratory's Envrionmental Scope of Accreditation.

26068-000-G27-JQ11-00004

STAC STACK TESTING ACCREDITATION COUNCIL

A2LA American Association for Laboratory Accreditation

Accredited Air Emission Testing Body

A2LA has accredited

AIR HYGIENE INTERNATIONAL, INC.

In recognition of the successful completion of the joint A2LA and Stack Testing Accreditation Council (STAC) evaluation process, this laboratory is accredited to perform testing activities in compliance with ASTM D7036:2004 - Standard Practice for Competence of Air Emission Testing Bodies.

Presented this 18th day of December 2019.

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3796.02
Valid to August 31, 2021

This accreditation program is not included under the A2LA ILAC Mutual Recognition Arrangement.

*o.r.: of reading

**Calculated value (4 - 20 mA)

Measured error % o.r.

For detailed data concerning output specifications of the unit under test, see Technical Information (TI), chapter Performance characteristics.

Calibration, traceable to NIST, has been completed on the instruments used in the equipment calibration process (see attached listing).

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approx. 95%. The expanded uncertainty of measurement includes uncertainty components of the reference, the calibration method, the environment and of the device under test. A typical value is used for the uncertainty component of the device

Calibration traceable to NIST has been completed on the instrument listed above by using known working procedures and standards certified by the manufacturers and/or secondary testing laboratories to traceable to NIST. This calibration has been completed using standards having a minimum accuracy of at least four times greater than the instrument listed above. This calibration was conducted in accordance with ISO 17025:2005 and ANSI/NCSL Z540-1. Reported uncertainties represent expanded uncertainties expressed at approximately 95% confidence level using a coverage factor of k=2.

Subject: RE: Orifice Plate Inspection Statement
Date: Friday, April 10, 2020 12:22:24 PM

Peter,

As the responsible I&C Startup lead on the project, I can attest that the Unit 3 duct burner fuel flow meter including the orifice run was installed correctly onsite and no nonconformances or defects were noted during its initial checkout and placement into operation. Similarly, the orifice plate and transmitter taps were installed per design and are correctly orientated for proper fuel flow measurement. I have also reviewed the AGA calibration records related to the Unit 3 fuel flow meter and noted no issues.

Regards,

Evan Keiper

Grade of Product: EPA Protocol

Part Number:	E03NI99E15A09J6	Reference Number:	122-401543888-1
Cylinder Number:	ALM-026215	Cylinder Volume:	144.4 CF
Laboratory:	124 - Durham (SAP) - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22019	Valve Outlet:	660
Gas Code:	CO,NO,NOX,BALN	Certification Date:	Jul 22, 2019

Expiration Date: Jul 22, 2027

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a mole/mole basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

CERTIFICATE OF ANALYSIS

Grade of Product: EPA Protocol

Part Number:	E02NI78E15A0124	Reference Number:	160-401525182-1
Cylinder Number:	CC270907	Cylinder Volume:	146.3 CF
Laboratory:	124 - Plumsteadville - PA	Cylinder Pressure:	2015 PSIG
PGVP Number:	A12019	Valve Outlet:	590
Gas Code:	O2,BALN	Certification Date:	Jun 17, 2019

Expiration Date: Jun 17, 2027

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a mole/mole basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty	Assay Dates
OXYGEN	22.00 %	22.22 %	G1	+/- 0.3% NIST Traceable	06/17/2019
NITROGEN	Balance			-

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

40CFR75 MONITORING PLAN

SUPPLEMENTAL INFORMATION

FACILITY DESCRIPTION

Cricket Valley Energy Center is a facility located in Dover Plains, New York. The facility consists of three natural gas-fired combined cycle electric generating units identified as U-00001, U-00002, and U-00003. This monitoring plan document pertains to the three General Electric (GE) Model 7FA.05 combustion turbine generators (CTGs) operating in combined-cycle mode with supplemental firing of the heat recovery steam generators (HRSGs) which has a generating capacity of 1,000 MW. Natural gas will be the sole fuel fired in the CTGs and duct burners. In addition to the air emitting equipment, the Facility will include three steam turbine generators (STGs), an air cooled condenser (ACC) and associated auxiliary equipment and systems. Each combined cycle generating unit consisting of the CTG, HRSG and STG will be exhausted through its own stack. Both dry-low NO_X burners (DLNB) and Selective Catalytic Reduction (SCR) are used for NO_X control on the all three Units. Exhaust gases from the turbines are discharged into the atmosphere through a stack approximately 282.5 feet above grade. A dedicated CEMS will monitor NO_X, and O_2 emissions and gas fuel flow from each of the three units.

This monitoring plan document pertains to the Continuous Emission Monitoring Systems (CEMS) for oxides of nitrogen (NO_x) and oxygen (O_2) that will be used to demonstrate continuous compliance with the reporting requirements set forth in Title 40 Code of Federal Regulations (CFR), Part 75.

GAS-FIRED STATUS

The combustion turbine generators will be fired exclusively with pipeline quality natural gas. Therefore, the Units will qualify as "gas-fired" under the definitions in 40 CFR §72.2 and are exempt from opacity monitoring requirements per 40 CFR §75.14(c).

SO_2 EMISSION CALCULATIONS

U-00001, U-00002, and U-00003 will utilize natural gas to fire the gas turbines. The natural gas fuel meets the definition of "pipeline natural gas" in 40 CFR §72.2 (i.e., contains 0.5 grains or less of total sulfur per 100 standard cubic feet). In addition, it must either be composed of at least 70 percent methane by volume or have a gross calorific value between 950 and 1100 Btu per standard cubic foot. Therefore, the National Allowance Data Base (NADB) default emission rate of 0.0006 pounds of SO_2 per million British thermal units and heat input will be used to calculate SO_2 mass emissions as per 40 CFR Part 75 Appendix D, Formula D-5.

CO_2 EMISSION CALCULATIONS

Carbon dioxide mass emissions will be calculated based on fuel flow as per the procedures in 40 CFR Part 75, Appendix G, Formula G-4.

NO_X AND HEAT INPUT MONITORING SYSTEM DESCRIPTION

Units U-00001, U-00002, and U-00003 extractive continuous emission monitoring system at the Cricket Valley Energy Center was manufactured by Custom Instrumentation Services Corporation of Englewood, Colorado. The portion of the CEMS used for 40 CFR Part 75 includes a NO_X and O_2 analyzer, programmable logic controller (PLC) and a data acquisition and handling system (DAHS). All analyses are on a "dry" basis from undiluted samples. Heat input is calculated using fuel flow (scf/hr) and the gross calorific value (Btu/scf) as per the procedures in 40 CFR Part 75, Appendix F, Section 5.5.2.

DATA TYPES

Data is written on an hourly basis to a Microsoft SQL Server database by CISCO CeDAR CEMS software, exported quarterly to an Extensible Mark-up Language (XML) file with CISCO Breez75x software, and submitted quarterly to the U.S. Environmental Protection Agency using their Emissions and Collection Monitoring Plan System (ECMPS) software. The following values are recorded on an hourly basis:

- NO_X ppm.
- Percent O_2.
- Natural gas fuel flow.
- Turbine load

In addition, fuel heating values (Btu/scf) are entered in the DAHS from fuel analysis performed according to 40 CFR 75 Appendix D, Section 2.3.4. These two values are used to calculate heat input on an hourly basis. NO_X lb/MMBtu is calculated using 40 CFR 75 Appendix F, Equation F-5, and SO_2 and CO_2 mass emissions are calculated based on fuel flow. Calibration results for the NO_X and O_2 analyzers are recorded daily.

MISSING DATA PROCEDURES

The DAHS will use the standard missing data procedures in 40 CFR Part 75.

- For periods of missing NO_X and/or O_2 data, the NO_X emission rate (lb/MMBtu) will be substituted based on load following 40 CFR Part 75, Subpart D. When required, the maximum NO_X emission rate (MER) will be substituted during the missing period.
- For periods of missing gas flow the missing data procedures for NO_X and SO_2 in 40 CFR §75.33 and 40 CFR Part 75, Appendix D, Section 2.4 will be used.
- For periods of missing fuel flow rate (hscf/hr) the data will be substituted based on lookback procedures as per 40 CFR Part 75, Appendix D §2.4.2.2.1.
- The maximum potential fuel flow rate will be substituted if no data in the lookback period at the corresponding or higher load range when only the same fuel was combusted exists.
- The Substitution routines have a maximum lookback period of 26280 hours.

NO_X CONTROL EQUIPMENT

The emission control system for NO_X consists of dry low NO_X burner (DLNB) and selective catalytic reduction (SCR) during natural gas firing.

VALUES IN MONITORING PLAN

The NO_X maximum potential concentration (MPC) of 150 ppm is used as per 40 CFR 75 Appendix A, Section 2.1.2, Table 2-2. The dual range NO_X analyzers have span low and high values set to 10 ppm and 200 ppm, respectively. The full-scale range of the NO_X analyzers is 10 ppm and 200 ppm. The O_2 span and range will be 25 percent. The maximum expected concentrations (MEC) for the low range of the analyzer is 2 ppm as stated in the New York State Department of Environmental Conservation Permit No. 3-1326-00275/00009. The majority of readings will fall between 20 - 80 percent of the analyzer range. The maximum emission rate (MER) was determined using the EPA Table value in Table 2-2 as per 40 CFR Part 75, Appendix A 2.1.2.1 (a) Option 2. The 150 ppm MPC, 19% O_2, and 8710 F_d factor were used to calculate the NO_X MER value as 1.716 lb/MMBtu using formula F-5.

To meet the 40 CFR 75 initial certification and ongoing quality assurance criteria calibration error tests and linearities will be performed. Calibration (zero and mid/high) and linearity (low, mid and high) gas levels will be based on the aforementioned span values, where zero, low-, mid- and high-level gases correspond to 0 to 20; 20 to 30; 50 to 60; and 80 to 100 percentages of span, respectively. All gases will meet the EPA Protocol Gas Verification Program (PGVP) requirements. Detailed information is provided in the attached Certification Protocol.

System Types Descriptions:
GAS - Gas Fuel Flow
NOX - NOx Emission Rate

System Designations Descriptions:
P - Primary

Sample Acquisition Method (SAM):
ORF - Orifice
EXT - Dry Extractive
COR - Coriolis

Component Types Descriptions:
GFFM - Gas Fuel Flowmeter
DAHS - Data Acquisition and Handling System
PLC - Programmable Logic Controller
NOX - NOx Concentration
O2 - O2 Concentration
PRB - Probe

Monitoring System Fuel Flow

Unit/Stack/Pipe Identifier	System ID	Fuel Code	Max Fuel Flow Rate	Units of Measure	Source Code	Begin Date/Hour	End Date/Hour
U001	G10	PNG	27375.6	HSCF	UMX	05/01/2019 00	

System Fuel Codes Descriptions: PNG - Pipeline Natural Gas
Units of Measure Descriptions: HSCF - Hundred Standard Cubic Feet / Hour
Source Codes Descriptions: UMX - Unit Maximum Rate

Analyzer Range Data

Unit/Stack/Pipe Identifier	Component Type	Component ID	Range Code	Dual Range Indicator	Begin Date/Hour	End Date/Hour
U001	NOX	110	Auto Ranging	Y	09/01/2019 00	
	O2	120	High Range		09/01/2019 00	

Component Types Descriptions: NOX - NOx Concentration
O2 - O2 Concentration

Emissions Formulas

Unit/Stack/Pipe Identifier	Parameter	Formula ID	Formula Code	Formula	Begin Date/Hour	End Date/Hour
U001	NOXR	11G	F-5		09/01/2019 00	
	NOX	11M	F-24A		09/01/2019 00	
	FGAS	12G	N-GAS		05/01/2019 00

Component Types Descriptions: NOX - NOx Concentration
O2 - O2 Concentration

Span Method Codes Descriptions: TB - Table Defaults from Part 75 or 40 CFR Part 63, Subpart UUUUU, Appendix A
PL - Permit Limit for NOX MEC

Units of Measure Descriptions: PPM - Parts per Million
PCT - Percentage

Unit/Stack/Pipe Load or Operating Level Information

Unit/Stack/Pipe Identifier	Maximum Hourly Load	Units of Measure	Upper Bound of Range of Operation	Lower Bound of Range of Operation	Designated Normal Op. Level	Second Most Frequently Used Op. Level	Second Normal Indicator	Load Analysis Date	Begin Date/Hour	End Date/Hour
U003	385	MW	381	284	High	Mid	Yes		05/01/2019 00	

Units of Measure Descriptions: MW - Megawatt

Monitoring Defaults

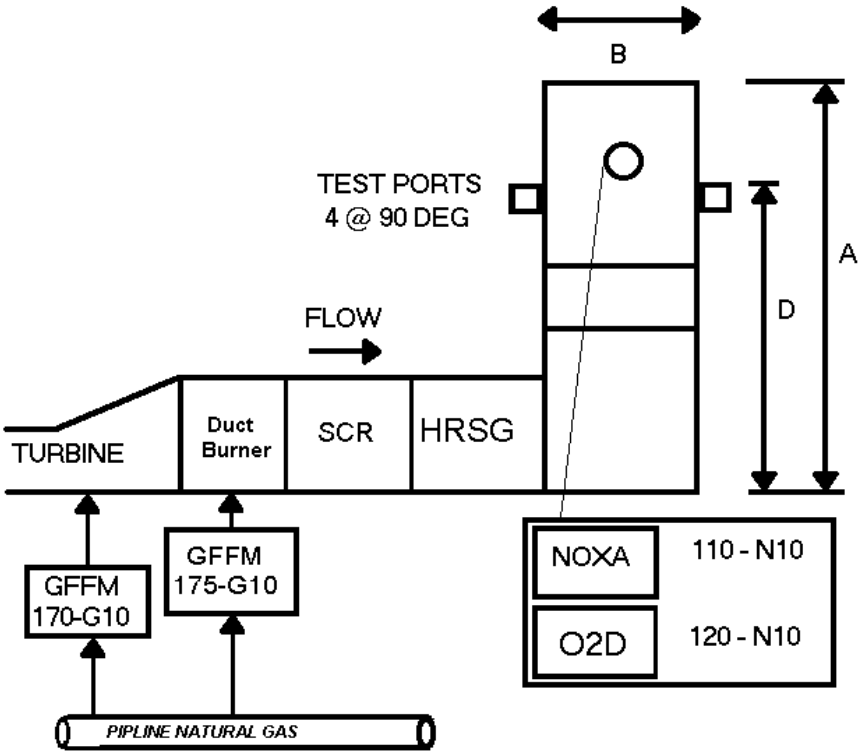
Unit/Stack/Pipe Identifier	Parameter	Value	Units of Measure	Purpose Code	Fuel Type	Operating Condition	Source of Value	Begin Date/Hour	End Date/Hour
U003	NORX	1.7160	LBMMBTU	MD	NFS	A	DEF	09/01/2019 00	
	O2X	19.0000	PCT	DC	NFS	A	DEF	09/01/2019 00	

Parameter Codes Descriptions: O2X - Maximum O2 Concentration (pct)
NORX - Maximum NOx Emission Rate (lb/mmBtu)

Units of Measure Descriptions: PCT - Percentage
LBMMBTU - Pounds / mmBtu

Purpose Codes Descriptions: MD - Missing Data (or Unmonitored Bypass Stack or Emergency Fuel) Default
DC - Diluent Cap

Fuel Type Codes Descriptions: NFS - Non-Fuel Specific



Operating Conditions Descriptions: A - Any Hour

Source Codes Descriptions: DEF - Default Value from Part 75

**Calculated value (4 - 20 mA)

Measured error % o.r.

For detailed data concerning output specifications of the unit under test, see Technical Information (TI), chapter Performance characteristics.

Calibration, traceable to NIST, has been completed on the instruments used in the equipment calibration process (see attached listing).

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approx. 95%. The expanded uncertainty of measurement includes uncertainty components of the reference, the calibration method, the environment and of the device under test. A typical value is used for the uncertainty component of the device

Calibration traceable to NIST has been completed on the instrument listed above by using known working procedures and standards certified by the manufacturers and/or secondary testing laboratories to traceable to NIST. This calibration has been completed using standards having a minimum accuracy of at least four times greater than the instrument listed above. This calibration was conducted in accordance with ISO 17025:2005 and ANSI/NCSL Z540-1. Reported uncertainties represent expanded uncertainties expressed at approximately 95% confidence level using a coverage factor of k=2.

Calibration traceable to NIST has been completed on the instrument listed above by using known working procedures and standards certified by the manufacturers and/or secondary testing laboratories to traceable to NIST. This calibration has been completed using standards having a minimum accuracy of at least four times greater than the instrument listed above. This calibration was conducted in accordance with ISO 17025:2005 and ANSI/NCSL Z540-1. Reported uncertainties represent expanded uncertainties expressed at approximately 95% confidence level using a coverage factor of k=2.

All Client supplied information and calibration results are considered proprietary and confidential to the Client. If a third party is a witness during calibrations or if the Client requests transmittal of data to a third party, Alden considers that the Client has waived confidentiality for the Witness.

In the event the Client distributes any report issued by Alden outside its own organization, such report shall be used in its entirety, unless Alden approves a summary or abridgment for distribution.

No advertising or publicity containing any reference to Alden or any employee, either directly or by implication, shall be made use of by Client without Alden's written approval.

INTRODUCTION

Meters referenced within this report were calibrated at Alden Research Laboratory, Inc. (Alden). Alden's standard test procedures in QMSM-01 Revision 8 were used for testing. Flow meter performance is presented in both tabular and graphical format.

FLOW ELEMENT INSTALLATION

Each meter under test (MUT) was installed in one of the four test lines in the Allen High Reynolds Number Facility, which is shown in plan view in Figure 1. One or two 300 horsepower centrifugal pumps, which are used singularly or in parallel, provide a maximum head of about 130 ft at a flow of about 44 ft^3/second in Line 2. A separate pump provides a maximum head of about 300 ft at a flow of about 12 ft^3/s in Lines 3 and 4. Water is provided from a heated 180,000 gallon sump under the test floor. The Gravimetric Method was used to measure flow.

The detailed piping arrangement, immediately upstream and downstream of the flow element, including all significant fittings and pipe lengths, is shown in the included figures. Careful attention was given to align the flow element with the test line piping, and to assure no gaskets between flanged sections protruded into the flow. Vents were provided at critical locations of the test line to purge the system of air.

TEST PROCEDURE

After checking the installation, water was introduced into the system to equalize line and primary element temperature to water temperature. The downstream control valve was then closed and vent valves in the test line were opened to remove air from the system.

Prior to the test run, the control valve was set to produce the desired flow, while the flow was directed to waste. Sufficient time was allowed to stabilize both the flow and the instrument readings, after which the weigh tank discharge valve was closed and the weigh tank scale indicator and the electric timer were both zeroed. To begin the test run, flow was diverted into the weigh tank, which automatically started the timer.

At the start of the water collection a computer based data acquisition system was activated to read the meter output, such that the meter output was averaged while the weigh tank was filling. At the end of the run, flow was diverted away from the weigh tank and the timer and data acquisition system were stopped to terminate the test run. The weight of water in the tank, elapsed time, water temperature, and

average meter output were recorded on a data sheet. The data were entered into the computer to determine the flow and the results were plotted so that each test run was evaluated before the next run began. The control valve was then adjusted to the next flow and the procedure repeated.

FLOW MEASUREMENT METHOD

Flow was measured by the gravimetric method using a tank mounted on scales having capacities of 1,000, 10,000 and 100,000 pounds with resolution of 0.1, 0.2 and 1.0 pound, respectively. Alden's flow meter calibrations using the gravimetric flow measurement method comply with ASME/ANSI MFC-9M-1988 Measurement of Liquid Flow in Closed Conduits by Weighing Method. Water passing through the flow element was diverted into the tank with a hydraulically operated knife edge passing through a rectangular jet produced by a diverter head box. A Hewlett-Packard 10 MHz Frequency Counter with a resolution 0.001 sec was started upon flow diversion into the tank by an optical switch, which is positioned at the center of the jet. The timer was stopped upon flow diversion back to waste and the elapsed diversion time was recorded. An RTD thermometer measured water temperature to allow calculation of water density. Volumetric flow was calculated by Equation (1).

$$q_a = \frac{W}{T\rho_w B_c} \tag{1}$$

where q_a = actual flow, ft^3/sec

W = mass of water collected, lb_m

T = time, sec

ρ_w = water density, lb_m/ft^3

B_c = buoyancy correction, $1-\rho_a/\rho_w$

The buoyancy correction includes air density calculated by perfect gas laws with the standard barometric pressure, a relative humidity of 75%, and measured air temperature. The weigh tank is periodically calibrated to full scale using 10,000 lbm of cast iron weights, whose calibration is traceable to NIST. Flow calculations are computerized to assure consistency. Weigh tank calibration data and water density as a function of temperature, are stored on disk file. Data were recorded manually and on disk file for later review and reporting.

DISCHARGE COEFFICIENT CALCULATIONS

If applicable, the MUT discharge coefficient, C, is defined by Equation (2) and plotted versus pipe or throat Reynolds number. Calculations of the discharge coefficient of differential producing flow meters are in accordance with ASME/ANSI MFC-3M-2004 Measurement of Fluid Flow in Pipes Using Orifice, Nozzle and Venturi, and ASME 19.5-2004 Flow Measurement. The discharge coefficient relates the theoretical flow to the actual flow.

$$C = \frac{q_a}{q_{th}} = \frac{q_a}{F_a K_M \sqrt{\Delta h}} \quad (2)$$

where C = discharge coefficient, dimensionless

q_{th} = theoretical flow, ft^3/sec

F_a = thermal expansion factor, dimensionless

Δh = differential head, ft at line temperature

K_M = meter constant, $ft^{2.5}/sec$

The theoretical proportionality constant, K_M, between flow and square root of differential head is a function of the meter throat area, the ratio of throat to pipe diameter, and the local gravitational constant, as defined by Equation (3).

$$K_M = \frac{a_t \sqrt{2 g_l}}{\sqrt{1-\beta^4}} \quad (3)$$

where a_t = throat area, $\pi d^2/4$, ft^2

d = throat diameter, ft

g_l = local gravitational constant, 32.1625 ft/sec^2 at Alden

β = ratio of throat to pipe diameter, d/D, dimensionless

D = pipe diameter, ft

The effect of fluid properties, viscosity and density, on the discharge coefficient is determined by Reynolds number, the ratio of inertia to viscous forces. Pipe Reynolds number, R_D, or throat Reynolds number, R_d is determined by Equation (4).

$$R_D = \frac{q_a D}{a_p \gamma} \qquad \left(R_d = \frac{q_a d}{a_t \gamma}\right) \tag{4}$$

where a_p = pipe area, $\pi D^2/4$, ft^2, (throat area $a_t = \pi d^2/4$, ft^2)

γ = kinematic viscosity, ft^2/sec

HEAD LOSS CALCULATION

If applicable , to determine the unrecoverable head loss if the MUT, pairs of pressure taps were installed approximately two pipe diameters upstream and ten pipe diameters downstream of the flow meter. This gross head loss was measured during the determination of the discharge coefficient. Thereafter, the flow meter was removed from the test line and the head loss due to the pipe was measured over a similar range of flows to determine the unique coefficients of k_p and n in Equation 5 below.

$$k_p = \frac{\Delta H_{fric}}{{q_a}^n} \tag{5}$$

Where:

k_p = friction loss coefficient, ft$^{5/2}$/s

ΔH_{fric} = pipe friction loss, feet

q_a = actual flow, ft^3/sec

n = Coefficient

Equivalent pipe losses were calculated by solving Equation 5 for pipe loss, DH_{fric}:

$$\Delta H_{fric} = k_p {q_a}^n \tag{6}$$

Pipe losses, characterized by Equation 6 were subtracted from the measured gross loss for the calculation of meter unrecoverable head loss as shown by Equation (7). The meter unrecoverable head loss is presented as a percent of the meter differential head.

$$\Delta H_{net\ meter} = \Delta H_{static} - \Delta H_{fric} \quad (7)$$

where: ΔH_{net} = meter unrecoverable head loss, feet

ΔH_{static} = measured static head difference, feet

FLOW METER SIGNAL RECORDING

The MUT indicated flow was recorded at the end of each weigh tank run. The method employed was according to the requirements of each meter and may include; gating the meter to totalize collected gallons, interrogating a mA output, totalized pulses, or manual reading of the MUT display. For MUT producing a differential pressure, the secondary element, which converts the primary element signal into engineering units, was one of several "Smart" differential pressure transmitters having a range of 250 inches of water column, 1,000 inches of water column and 100 psi. Each transmitter was calibrated with a pneumatic or a hydraulic dead weight tester having an accuracy of 0.02% of reading. Transmitter signals were recorded by a PC based data acquisition system having a 16 bit A to D board. Transmitter calibrations were conducted with the PC system such that an end to end calibration was achieved. Transmitter output was read simultaneously with the diversion of flow into the weigh tank at a rate of about 34 Hz for each test run (flow) and averaged to obtain a precise differential head. Average transmitter reading was converted to feet of flowing water using a linear regression analysis of the calibration data and line water temperatures to calculate appropriate specific weight.

TEST RESULTS

The results are presented in tabular and graphical format. The calculated flow, meter signal and meter performance are listed in the table(s) in the following pages.

Analysis indicates that the flow measurement uncertainty is within 0.25% of the true value for each test run. Calibrations of the test instrumentation (temperature, time, weight, and length measurements) are traceable to the National Institute of Standards and Technology (formerly the National Bureau of Standards) and Alden's Quality Assurance Program is designed to meet ANSI/NCSL Z540-1-1994 "Calibration Laboratories and Test Equipment-General Requirements" (supercedes MIL-STD-45662A).

THERMAL EXPANSION FACTOR

The dimensions of a differential producing flow meter are affected by the operating temperature, requiring a Thermal Expansion Factor (F_a) to be included in the calculations. The calculation requires the temperature at which the meter dimensions were measured be known. If this information is not available, an ambient temperature of 68˚ F is assumed. The Thermal Expansion Factor is calculated according to the American Society of Mechanical Engineers Standard ASME MFC-3M-1989, Equation 17 (pg 11).

$$F_a = 1 + \frac{2}{1-\beta^4}\left(\alpha_{PE} - \beta^4{}_{meas}\ \propto_p\right)(t - t_{meas})$$

where β = ratio of throat diameter to pipe diameter, dimensionless

α_{PE} = thermal expansion factor of primary element, (in./in./°F)

$\propto_p$ = thermal expansion factor of pipe, (in./in./°F)

t = temperature of flowing fluid, ˚F

t_{meas} = temperature of measurements, ˚F

Thermal expansion factors, α, excerpted from MFC-3M-1989, are listed in the Table below for six typically used materials at three temperatures. Linear interpolation is used to determine the coefficients at flowing temperature.

Mean Coefficient of Thermal Expansion = $\frac{A}{10^6}$ (in./in./°F)

Material	Coef.	-50 ˚F	70 ˚F	200 ˚F
Bronze 4-10	A	9.15	9.57	10.03
300 Series Stainless Steel	A	8.90	9.11	9.34
Monel	A	7.15	7.48	7.84
.2 to 1.1% C Steel	A	5.80	6.07	6.38
5% Chrome Moly	A	5.45	5.73	6.04
410 to 430 Stainless Steel	A	5.00	5.24	5.50

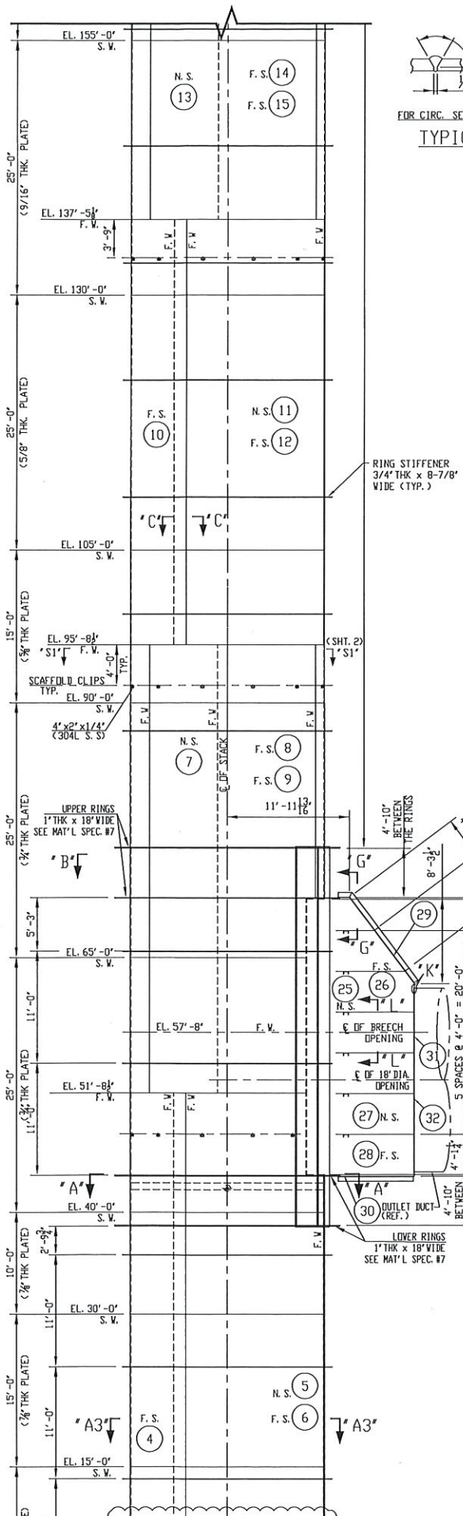
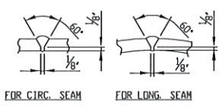
ATTACHMENT 3

FUEL ANALYSIS DOCUMENT

9.3 Delivery Point Conforming Gas Quality Maximums. The gas to be made available to or on behalf of Shipper at the Delivery Point(s) on Transporter's system, as measured at the applicable monitoring point, shall not exceed any of the following maximum average daily requirements unless Transporter and Delivery Point Operator that would be receiving such non-conforming gas otherwise agree:



a) Heating Value - one thousand one hundred ten (1,110) Btu's per cubic foot; and
b) Wobbe Index - one thousand three hundred seventy three (1,373) Btu's per cubic foot through 12/31/2011; one thousand four hundred (1,400) Btu's per cubic foot on and after 1/1/2012; and
c) Cricondentherm Hydrocarbon Dew Point - fifteen (15) degrees Fahrenheit; and
d) Non-methane Hydrocarbons (C2+) - eight and one-quarter percent (8.25%) by volume through 12/31/2011; twelve percent (12%) by volume on and after 1/1/2012: and
e) Heavy Hydrocarbons (C4+) - one and one half percent (1.5%) by volume; and
f) Temperature - one hundred twenty (120) degrees Fahrenheit; and
g) Sulfur - one and one quarter (1.25) grains per one hundred cubic feet; and
h) Hydrogen Sulfide - one quarter (0.25) grain per one hundred cubic feet; and
i) Oxygen - two-tenths of one percent (0.2%) by volume; and
j) Carbon Dioxide - two percent (2.0%) by volume; and
k) Nitrogen and Oxygen - two and one-half percent (2.5%) by volume of a combined total of nitrogen and oxygen components through 12/31/2011; two and three-quarters percent (2.75%) by volume of a combined total of nitrogen and oxygen components on and after 1/1/2012; and
l) Carbon Dioxide and Nitrogen - Not more than four percent (4%) by volume of a combined total of carbon dioxide and nitrogen components, and
m) Entrained Water - four (4) pounds per million cubic feet, at a pressure base of fourteen and seventy-three hundredths (14.73) pounds per square inch and a temperature of sixty (60) degrees Fahrenheit as determined by dew-point apparatus approved by the National Institute of Standards and Technology or such other apparatus as may be mutually agreed upon; and
n) Polychlorinated Biphenyl (PCB) - one-tenth (0.1) part PCB per billion parts natural gas.



The limitations set forth above in this Section 9.3 shall each apply independently.
